Definition of σ -harmonic mappings [Garabedian]

Let σ be a smooth positive metric density on Ω . If a mapping u of Ω onto Ω' is a critical point of the energy functional

$$E_1^{\sigma}(z) = \iint_{\Omega} \sigma(z) |u_z|^2 dx dy,$$

or

$$E_2^{\sigma}(z) = \iint_{\Omega} \sigma(z) |u_{\bar{z}}|^2 dx dy,$$

then it satisfies the Euler-Lagrange equation

$$(\sigma(z)u_z)_{\bar{z}} = 0, \tag{1}$$

or

$$(\sigma(z)u_{\bar{z}})_z = 0, \tag{2}$$

respectively. We note that we can get them from first variation.

Xingdi Chen (Huaqiao University)

Weighted Harmonic Mappings

α -harmonic mapping, $\bar{\alpha}$ -harmonic mapping

Let $\sigma(z) = (1 - |z|^2)^{-\alpha}$ in the unit disk, herein $\alpha > -1$. We write

$$L_{\alpha}u=((1-|z|^2)^{-\alpha}u_z)_{\bar{z}}$$

and

$$\overline{L_{\alpha}}u = ((1 - |z|^2)^{-\alpha}u_{\overline{z}})_z.$$

If f satisfies that

$$-L_{\alpha}u=0,$$

or

$$-\overline{L_{\alpha}}u=0,$$

then we call it a α -harmonic mapping or a $\bar{\alpha}$ -harmonic mapping, respectively.

If u satisfies that

$$T_{\alpha}u = \frac{1}{2}L_{\alpha}u + \frac{1}{2}\overline{L_{\alpha}}u - \frac{\alpha^{2}}{4}(1 - |z|^{2})^{-\alpha - 1}u$$

= $\frac{1}{2}((1 - |z|^{2})^{-\alpha}u_{z})_{\bar{z}} + \frac{1}{2}((1 - |z|^{2})^{-\alpha}u_{z})_{\bar{z}} - \frac{\alpha^{2}}{4}(1 - |z|^{2})^{-\alpha - 1}u = 0$

then we call it a T_{α} -harmonic mapping.

If $\alpha = 2$, then $T_2 u = 0$ can be simplified as $\overline{z}\partial_{\overline{z}}u(z) + z\partial_z u(z) + (1 - |z|^2)\partial_z \partial_{\overline{z}}u(z) = u(z).$ (3)

The associated Dirichlet boundary value problem of the α -harmonic equation or $\bar{\alpha}$ -harmonic equation is the following problem:

$$\begin{aligned} & -L_{\alpha} \mathbf{v} = \mathbf{g} \quad \text{ in } \ \mathbb{D}, \\ & \mathbf{v} = \mathbf{f} \quad \text{ on } \ \mathbb{T}, \end{aligned}$$

or

$$\begin{cases} -\overline{L_{\alpha}}v = g & \text{ in } \mathbb{D}, \\ v = f & \text{ on } \mathbb{T}, \end{cases}$$

here $g \in C(\mathbb{D})$, $f \in L^1(\mathbb{T})$, and the boundary condition is to be understood as $u(re^{i\theta}) \to f$ in $L^1(\mathbb{T})$ when $r \to 1$.

Green function

Green's function $G_{\alpha}(z, w)$ of the weighted Laplacian operator L_{α} is the function defined on $\Omega \times \Omega$ solving for fixed $w \in \Omega$:

(1)
$$-L_{\alpha}G_{\alpha}(z,w) = \delta(z-w),$$

(2) $G_{\alpha}(z,w) \rightarrow 0,$ when $z \rightarrow \zeta \in \partial \Omega$

where $\delta(z - w)$ is the Dirac function in *z* with support at *w* and similarly if we interchange the roles of *z* and *w*.

A route to get Green function for a given PDE

Find a radial solution (fundamental solution) of the PDE, that is, turn the PDE into a differential equation in *r* and then solve it, Deform the fundamental solution by Möbius transformation $g(z, w) = c \frac{z-w}{1-\bar{w}z}$ with |c| = 1, Normalize the deformation solution by Green theorem to get

Green function.

Green function

For example, Green function for L_{α} Let F = F(|z|), then

$$L_{\sigma}(F) = \overline{L}_{\sigma}(F) = \frac{\partial \sigma(r)}{\partial r} \frac{\partial}{\partial r}(F) + \sigma(r) \frac{1}{r} \frac{\partial}{\partial r}(r \frac{\partial}{\partial r}(F)).$$
(4)

$$F(r) = \int rac{c}{r
ho(r)}dr, \qquad F(r) = c\int rac{(1-r^2)^{lpha}}{r}dr,$$

$$\Phi(z) = \frac{1}{2\pi} \int_{|z|}^{1} \frac{(1-r^2)^{\alpha}}{r} dr$$

$$G_{\alpha}(z,w) = (1-\bar{z}w)^{\alpha}\Phi(g(z,w))$$

Xingdi Chen (Huaqiao University)

・ロト ・ 四ト ・ ヨト ・ ヨト

Write

$$P_{\alpha}(z) = P_{r}^{\alpha}(\theta) = \frac{1}{2\pi} \frac{(1-|z|^{2})^{\alpha+1}}{(1-\bar{z})^{\alpha+1}(1-z)}, \quad z = re^{i\theta}.$$
 (5)

Then it is a $\bar{\alpha}$ -harmonic mapping and we call it the $\bar{\alpha}$ -*Poisson kernel*. Specially, if $\alpha = 0$, then $P_r^{\alpha}(\theta)$ is the classical Poisson kernel

$$P_r(heta) = rac{1}{2\pi} rac{1-|z|^2}{|1-z|^2}, \quad z = r e^{i heta}.$$

Integral Representation [Oloffson, Behm, Chen and Kalaj]

$$\mathbf{v}(\mathbf{w}) = \mathbf{u}(\mathbf{w}) + \mathbf{G}_{\alpha}[\mathbf{g}](\mathbf{w}),$$

where

$$egin{aligned} u(w) &= rac{1}{2\pi} \int_{\mathbb{T}} rac{(1-|w|^2)^{lpha+1}}{(1-zar w)^{lpha+1}(1-ar zw)} f(z) d heta, \ G_lpha[g](w) &= \int_{\mathbb{D}} G_lpha(z,w) g(z) dx dy, \end{aligned}$$

$$G_{\alpha}(z,w)=rac{(1-ar{z}w)^{lpha}h\circ q}{2\pi},\ z
eq w,$$

$$h(r) = \frac{1}{2} \int_0^{1-r^2} \frac{t^{lpha}}{1-t} dt, \ \ q = q(z,w) = |\frac{z-w}{1-\bar{w}z}|.$$

Xingdi Chen (Huaqiao University)

Series representation [Chen, Kalaj]

An $\bar{\alpha}$ -harmonic mapping u(z) in the unit disk \mathbb{D} can be represented by the Fourier series $f(e^{it}) = \sum_{n=0}^{\infty} a_n e^{int} + \sum_{n=1}^{\infty} \overline{b_n} e^{-int}$. Then

$$u(z) = \sum_{n=0}^{\infty} a_n z^n + \sum_{n=1}^{\infty} \overline{b_n} [\sum_{k=0}^{\infty} {\binom{k+n-1}{k}} (1-|z|^2)^k - (1-|z|^2)^{\alpha+1} \sum_{k=0}^{\infty} {\binom{n+\alpha+k}{k+\alpha+1}} (1-|z|^2)^k] \bar{z}^n, \quad (6)$$

$$u(z) = \sum_{n=0}^{\infty} a_n z^n + \sum_{n=1}^{\infty} \overline{b_n} [(1 - |z|^2)^{\alpha + 1} \sum_{k=0}^{\infty} \frac{(\alpha + 1)_{(k+n)} |z|^{2k}}{(k+n)!}] \bar{z}^n, \quad (7)$$

where $(\alpha + 1)_k = (\alpha + 1)(\alpha + 2) \cdots (\alpha + k)$ and $(\alpha + 1)_0 = 1.$

Assume that a Fourier series $f(e^{it}) = \sum_{n=0}^{\infty} a_n e^{int} + \sum_{n=1}^{\infty} \overline{b_n} e^{-int}$. Let $f(w) = h(w) + \overline{g(w)}, h(w) = \sum_{n=0}^{\infty} a_n w^n$ and $g(w) = \sum_{n=1}^{\infty} b_n w^n$. If α is a nonnegative integer *m* and *u* has a boundary function $f \in L^1(T)$, then

$$u(w) = h(w) + \sum_{k=0}^{m} (1 - |w|^2)^k \overline{I_k},$$
(8)

where I_k satisfies the recurrence formula

$$I_{k} = \frac{(k-1)I_{k-1} + wI_{k-1}'}{k}, \quad k = 1, 2, \cdots, m,$$
(9)

and $I_0 = g(w)$.

when $\alpha = 1$,

$$u(w) = h(w) + \overline{g(w)} + (1 - |w|^2)\overline{wg'(w)};$$

when $\alpha = 2$,

$$u(w) = h(w) + \overline{g(w)} + (1 - |w|^2) \overline{wg'(w)} + (1 - |w|^2)^2 [wg'(w) + \frac{w^2 g''(w)}{2}].$$

A T_2 -harmonic mapping has a representation

$$u(z) = rac{1}{2}(1-|z|^2)(zg_z(z)+ar{z}g_{ar{z}}(z))+rac{1}{2}(1+|z|^2)g(z), \ z\in\mathbb{D},$$
 (10)

where g(z) is a harmonic mapping in \mathbb{D} .

Radó-Kneser-Choquet Theorem

If $\Omega \subset \mathbb{C}$ is a bounded convex domain whose boundary is a Jordan curve Γ and *f* is a homeomorphism of the unit circle \mathbb{T} onto Γ , then its harmonic extension

$$u(w) = rac{1}{2\pi} \int_{\mathbb{T}} rac{1 - |w|^2}{|e^{it} - w|^2} f(e^{it}) dt$$

is univalent in $\mathbb D$ and defines a Euclidean harmonic mapping of $\mathbb D$ onto $\Omega.$

Weighted Harmonic Mappings

Counterexample for Radó-Kneser-Choquet Theorem

Counterexample Theorem [Chen, Kalaj]

Assume that $f(e^{it}) = e^{it} + \frac{1}{s}e^{-2it}$, $s \ge 2$. Let *u* be an $\bar{\alpha}$ -harmonic mapping with the boundary function *f*. Then the following assertions are true.

(1) *f* maps the unit circle \mathbb{T} onto a convex Jordan curve if and only if $s \ge 4$.

(2) When α is equal to 1, the Jacobian $J_u > 0$ if $s \ge 4$ hence u is globally univalent on \mathbb{D} .

(3) When α is equal to 2, *u* is not univalent on \mathbb{D} if s = 4.

イロン イ理 とく ヨン イヨン

Eulcidean harmonic quasiconformal mappings [Pavlovic, Kalaj]

$\bar{\alpha}$ -harmonic quasiconformal mappings [Chen]

Assume that $v \in V_{\mathbb{D}\to\Omega}[g]$ with the representation $v(w) = u(w) + G_{\alpha}[g](w)$. Then the following conditions are equivalent. (a) v is a (K, K')-quasiconformal mapping and $|\frac{\partial u}{\partial r}| \leq L$ on \mathbb{D} , here L is a constant.

(b) v is Lipschitz continuous with the Euclidean metric.

(c) *u* is Lipschitz continuous with the Euclidean metric.

(d) *f* is absolutely continuous on \mathbb{T} , $f' \in L^{\infty}(\mathbb{T})$ and the following integral

$$\frac{1}{2\pi}\int_{\mathbb{T}}\frac{(1-|w|^2)^{\alpha}}{(1-z\bar{w})^{\alpha}}\frac{(w\bar{z}-\bar{w}z)/i}{|z-w|^2}[f(e^{i\theta})]_{\theta}'d\theta$$

is bounded, here $z = e^{i\theta}$.

Decomposition of Poisson kernel for T_{α}

The following kernel function

$$\mathcal{K}_lpha(z)=c_lpharac{(1-|z|^2)^{lpha+1}}{|1-z|^{lpha+2}}$$

is a T_{α} -function. Here, $c_{\alpha} = \frac{[\Gamma(\frac{\alpha}{2}+1)]^2}{\Gamma(1+\alpha)}$ and $\Gamma(s) = \int_0^{\infty} t^{s-1} e^{-t} dt$ for s > 0 is the standard Gamma function.

$$\begin{split} \mathcal{K}_{2}(z) &= \frac{1}{2} \frac{(1 - |z|^{2})^{3}}{|1 - z|^{4}} \\ &= -\frac{1}{2} (1 - |z|^{2}) + \frac{1}{2} \frac{1}{(1 - z)^{2}} + \frac{1}{2} \frac{1}{(1 - \bar{z})^{2}} \\ &- \frac{1}{2} \frac{z^{2} |z|^{2}}{(1 - z)^{2}} - \frac{1}{2} \frac{\bar{z}^{2} |z|^{2}}{(1 - \bar{z})^{2}}, \end{split} \tag{11}$$

Boundary functions

$$f_a(e^{i\theta}) = \begin{cases} 1, & |\theta - \varphi| < \frac{(1+2a)\pi}{2} \\ -1, & \frac{(1+2a)\pi}{2} < |\theta - \varphi| < \pi \end{cases}$$
(12)

and

$$f_{-a}(e^{i\theta}) = \begin{cases} 1, & |\theta - \varphi| < \frac{(1-2a)\pi}{2} \\ -1, & \frac{(1-2a)\pi}{2} < |\theta - \varphi| < \pi \end{cases}$$
(13)

• • • • • • • • • • • •

Schwarz Lemma [Chen, Li]

Let $F : \mathbb{D} \to I$ be a T_2 -harmonic function. Then for any $z = re^{i\varphi} \in \mathbb{D}$, we have

$$\tilde{F}_a(-r) \le F(z) + (1-r^2)F(0) \le \tilde{F}_a(r) \tag{14}$$

Here

$$\tilde{F}_a(r) = \frac{2}{\pi} \left[\frac{r(1-r^2)\cos a\pi}{1+r^2+2r\sin a\pi} + \arctan(\frac{r+\sin a\pi}{\cos a\pi}) + r^2\arctan(\frac{r\cos a\pi}{1+r\sin a\pi}) \right]$$

Equality on the right (resp., left-) hand side holds for the function

$$F(z) = \frac{1}{2\pi} \int_{-\pi}^{\pi} K_2(z e^{-i\theta}) f_a(e^{i\theta}) d\theta$$
(15)

$$(resp., F(z) = -\frac{1}{2\pi} \int_{-\pi}^{\pi} K_2(ze^{-i\theta}) f_{-a}(e^{i\theta}) d\theta)$$
(16)

and all z ⊂ D Xingdi Chen (Huaqiao U<u>niversity)</u>

F(0) = 0

Let $F : \mathbb{D} \to I$ be a T_2 -harmonic functions. Then for any $z = re^{i\varphi} \in \mathbb{D}$ with F(0) = 0, we have

$$|F(z)| \leq rac{2}{\pi}[(1+r^2)\arctan r + rac{r(1-r^2)}{1+r^2}]$$

Equality holds for the function

$$F(z) = \frac{1}{2\pi} \int_{-\pi}^{\pi} K_2(z e^{-i\theta}) f_0(e^{i\theta}) d\theta$$

and all $z \in \mathbb{D}$.

Thank you for your attentions!
