## MAT131 Fall 2022 Final Exam Review Sheet

The final exam is on Wednesday, December 7 from 2:15 PM to 5 PM. The final exam will be **cumulative**. Please look at the review sheets for Midterms 1 and 2 to review the material from earlier in the semester. (We may choose to write up a few more problems from earlier in the semester. You can find many more such problems in the textbook and on exams from previous semesters.)

Particular emphasis on the final will be placed on the material which has not been tested on Midterms 1 or 2. Among this new material is the following.

- (1) Optimization problems. Compute the absolute maximum / absolute minimum of a function on an interval coming from a word problem.
- (2) Riemann sums. Know the definition of a partition of an interval, know how to compute the length of the subintervals of the interval, know what are sample points, know how to compute the signed area of each subinterval for a specified sample point, know the definition of the Riemann sum associated to a partition and specified sample points, e.g., left endpoints or right endpoints of each subinterval.
- (3) Sigma notation, also known as summation notation. Know how to evaluate elementary sums, such as sums of polynomials of low degree in the index, as well as geometric sums.
- (4) Be able to compute the Riemann sum of a simple integrand such as a low degree polynomial or an exponential function by evaluating a limit of Riemann sums.
- (5) Recognize a limit of sums as a Riemann integral.

- (6) Antiderivatives. Recognize the most common antiderivatives: those arising as the derivatives of  $x^n$ , trigonometric functions, exponential functions, logarithmic functions and inverse trigonometric functions.
- (7) Find other antiderivatives by guessing the general form of the antiderivative with undetermined coefficients, and then use the derivative of this general form to compute the coefficients.
- (8) Know the statement of the Fundamental Theorem of Calculus. Understand how to use this to evaluate definite integrals when you can find a simple form for the antiderivative.
- (9) Understand how the fundamental theorem always gives an antiderivative of a continuous function, where the antiderivative is defined in terms of the Riemann integral/definite integral.
- (10) Simplify and evaluate antiderivatives using direct substitution.

Following are some practice problems. More practice problems are in the textbook as well as on the practice midterm.

**Problem 1.** Compute the maximal fraction of the area of a circle contained in an inscribed triangle.

**Problem 2.** Compute the maximal fraction of the area of a circle contained in an inscribed rectangle.

**Problem 3.** For each integer n = 2, 3, ..., what is the maximum possible height of a tower of nested hemispheres as a multiple of the radius of the base hemisphere?

**Problem 4.** What is the maximum possible fraction of the volume of a sphere contained in an inscribed right circular cone?

**Problem 5.** What is the minimum possible fraction of the volume of a sphere contained in an inscribed right circular cylinder?

**Problem 6.** In each of the following cases, sketch the graph of the given function. On your graph state whether the function is even, odd or neither. State whether or not the function is periodic, and state the period if it is periodic. Label all discontinuities and the type. Label all vertical and horizontal asymptotes.

Label *both* the x and y-coordinates of all local maxima and minima and state where the function is increasing and where decreasing. Label *both* the x and y-coordinates of all inflection points and state where the function is concave up and where concave down.

(a)	$y = x^2 - 4.$
(b)	$y = \frac{1}{x^2 - 4}$
(c)	$y = \frac{1}{x+1} - 2 + \frac{1}{x-1}.$
(d)	$y = \sin(x)$
(e)	$y = \tan(x)$
(f)	$y = \sin(x)\cos(x)$
(g)	$y = e^{-x^2/2}$
(h)	$y = \ln((x+1)^2/(x-1)^2).$
(i)	$y = \frac{e^x}{1 - e^x}$ .
(j)	$y = e^{-1/x^2}.$

**Problem 7** Let S be the square in the xy-plane centered at the origin, of edge length  $\sqrt{2}$ , and with diagonal edges of slopes +1 respectively -1. The equation for this square is

$$|x| + |y| = 1.$$

Let R be a square in the xy-plane centered at the origin whose horizontal and vertical edges are parallel to the x-axis and y-axis respectively. Among squares R which intersect S, what is the maximum possible area of the region lying outside the inner square and inside the outer square?

**Problem 8** Compute the maximum volume of a right circular cone whose surface area (just of the cone, not of the "bottom" disk of the cone) is a fixed constant A. The surface area of a right circular cone is  $A = \pi rs$  where r is the radius of the bottom disk and s is the *slant height*, i.e., the distance from the vertex of the cone to a point on the bottom circle of the cone. What is the ratio of radius to height for such a cone?

**Problem 9** You will build a box in a corner of a room using the floor and two walls as sides of the box. To do this, remove a square from one corner of a square sheet of metal of edge length 10 feet. Fold the edges of the sheet meeting the missing square to form two sides of a box. The remaining square of the sheet forms the top of the box. Slide these three sides into the corner to form a box with square top. What is the maximum volume of this box?

**Problem 10** A parabola opening down has y-intercept at the point (0, c) for a positive real number c and has x-intercepts at  $(\pm \sqrt{c/|a|}, 0)$  for a negative real number c. Set up the Riemann integral for the area of the bounded region in the first and second quadrants bounded below by the x-axis and bounded above by the parabola. Set up the Riemann sums. Use summation formulas and limits to evaluate this Riemann integral.

**Problem 11** By thinking about areas compute an antiderivative of  $\sqrt{1-x^2}$ . (Hint: Sketch the region whose area is the definite integral of this function from 0 to x.)

**Problem 12** Consider the Riemann integral

$$\int_{1}^{4} (2x+1)dx$$

Partition the interval into n subintervals of equal length. Compute the Riemann sum  $S_n$  for this partition using right endpoints. Write down the value of this Riemann sum. Directly compute the limit as n goes to infinity to find the Riemann integral. Double-check your answer against the Fundamental Theorem of Calculus.

Problem 13 Consider the Riemann integral

$$\int_0^1 3^x dx.$$

Partition the interval into n subintervals of equal length. Compute the Riemann sum  $S_n$  for this partition using left endpoints. Write down the value of this Riemann sum. Directly compute the limit as n goes to infinity to find the Riemann integral (you may use L'Hôpital's rule to evaluate the limit). Double-check your answer against the Fundamental Theorem of Calculus.

Problem 14 Compute each of the following definite and indefinite integrals. (a)

(b) 
$$\int x^{-1/2} dx$$
$$\int (x + \sin(x)) dx$$

(c) 
$$\int \frac{1}{\sqrt{1-x^2}} dx$$

(d) 
$$\int \sec(\theta) \tan(\theta) d\theta$$

(e) 
$$\int_{-2}^{2} x^4 dx.$$

(f)

$$\int_{-\pi/2}^{\pi/2} \cos(2x) - \cos(2x) = 0$$

$$\int_{-\pi/2}^{\pi/2} \cos(2x) - \cos(x) dx$$

(g) 
$$\int_{0}^{1/2} \frac{1}{\sqrt{1-x^2}} dx$$

(h)

$$\int_{\pi/4}^{\pi/3} \sec^2(\theta) d\theta$$

Problem 15 Evaluate each of the following limits. (a)

$$\lim_{n \to \infty} \frac{1}{n} \sum_{k=1}^{n} 1.$$

(b) 
$$\lim_{n \to \infty} \frac{1}{n} \sum_{i=1}^{n} (1 - \frac{2i}{n})$$

$$\lim_{n \to \infty} \sum_{i=1}^n \frac{n-2i}{n^2}.$$

(d) 
$$\lim_{n \to \infty} \sum_{i=0}^{n-1} \frac{2^{i/n}}{n}$$

(e)

$$\lim_{m \to \infty} \sum_{i=1}^m \frac{m}{m^2 + i^2}$$

n

 $\label{eq:problem 16} \textbf{Problem 16} \ \textbf{Compute each of the following indefinite and definite integrals}.$ (a)

$$\int_{a}^{b} f'(cx) dx, \quad c > 0$$

(b)  

$$\int x \sin(x^2) dx$$
(c)  

$$\int_0^{\pi/4} \tan(x) dx$$

(d) 
$$\int_0^{\pi/2} \sin^3(x) dx$$

(e) 
$$\int \frac{\ln(x)}{x} dx$$

(f) 
$$\int_{1}^{2} \frac{e^{\ln(x)}}{x} dx$$

(g)

$$\int_0^{x^2} \frac{f'(\sqrt{t})}{\sqrt{t}} dt$$

**Challenge Problem 17** For a real number  $b = e^B$  with b > 1, i.e., B > 0, partition the interval [1, b] into N subintervals  $[x_{i-1}, x_i]$  for i = 1, ..., N that have **unequal** lengths  $\Delta x_i = x_i - x_{i-1}$  by the rule  $x_k = e^{kB/n} = b^{k/n} = q^k$ , for  $q = b^{1/n} = e^{B/n}$ . Approximate the Riemann integral,

$$\int_{x=1}^{b} x^{-1} dx$$

by the Riemann sum  $L_N$  for this partition using left endpoints. Use L'Hopital's rule to evaluate the limit,

$$\lim_{n \to \infty} n(b^{1/n} - 1) = \lim_{h \to 0^+} \frac{b^h - 1}{h},$$

where h equals 1/n. Combine this with the formula for a geometric sum to directly compute the limits as N tends to  $\infty$  of  $L_N$  and  $R_N$ . Use this to directly compute that the Riemann integral equals  $\ln(b)$ .

**Challenge Problem 18** Let p, q, r, s be real numbers such that p, r and ps - qr is nonzero. For the following antiderivative problem,

$$\int \frac{1}{(px+q)(rx+s)} dx,$$

use the following direct substitution to compute the antiderivative,

$$u = \frac{px+q}{rx+s}.$$

Remember to back-substitute to get an answer that is a function of only x for your antiderivative. What happens if p and r are nonzero real numbers, but ps - qr equals 0?

Challenge Problem 19 Let r and s be real numbers with r and s both nonzero. For the following at derivative,

$$\int \frac{1}{x(rx^2+s)} dx,$$

use the following direct substitution to compute the antiderivative,

$$v = x^2$$
.

Remember to back-substitute to get an answer that is a function of only x for your antiderivative. What happens if r is nonzero, but s equals 0?

Challenge Problem 20 What is the largest possible volume of a box with square top and bottom that is sitting on top of a flat floor and contained under a hemisphere resting on the floor with radius r? What is the ratio of height of the box to edge length of the base square for the optimal volume?

Challenge Problem 21 In this problem you can use the limit proved in lecture, that for every positive real number q,

$$\lim_{h \to 0} \frac{q^h - 1}{h} = \left. \frac{dq^x}{dx} \right|_{x=0} = \ln(q).$$

For every real number r and for every positive real number b, use the limit above to directly compute the limit of the difference quotient in the derivative,

$$\left. \frac{dx^r}{dx} \right|_{x=b} = \lim_{x \to b} \frac{x^r - b^r}{x - b},$$

by substituting  $x = q^h b$  for a positive real  $q \neq 1$  and a real number h that limits to 0. Simplify the difference quotient, and express your answer in terms of a fraction of limits as above. Use this to prove that the derivative of  $x^r$  equals  $rx^{r-1}$  for all real numbers r and all x > 0.
