

### Solutions for MAT 125 First Midterm

February 23, 2009

1. Let  $f(x) = x^2 + 3x$  with domain all real numbers. Let  $A = (1, f(1))$  and  $B = (2, f(2))$ . There is also the point  $C = (x, f(x))$  with  $x$  close to 1.

(a) Calculate the slope of the line through  $A$  and  $B$ .

*Solution.* The line through two points  $(x_1, y_1)$  and  $(x_2, y_2)$  has slope

$$m = \frac{y_2 - y_1}{x_2 - x_1}.$$

In this case take

$$(x_1, y_1) = A = (1, f(1)) = (1, 4)$$

and

$$(x_2, y_2) = B = (2, f(2)) = (2, 10).$$

This gives

$$m = \frac{10 - 4}{2 - 1} = 6.$$

(b) Give an equation for the line through  $A$  and  $B$ .

*Solution.* An equation for the line with slope  $m$  which contains a point  $(x_1, y_1)$  is

$$y - y_1 = m(x - x_1).$$

By part (a) we know that the slope is  $m = 6$ . Taking  $(x_1, y_1) = A = (1, 4)$  gives the equation

$$y - 4 = 6(x - 1)$$

which can be simplified to

$$y - 6x + 2 = 0.$$

(c) Explain that the slope of the line through  $A$  and  $C$  is given by

$$\text{slope} = \frac{x^2 + 3x - 4}{x - 1}.$$

*Solution.* By the same reasoning used in part (a), the slope of the line through  $A = (1, 4)$  and  $C = (x, f(x))$  is

$$\text{slope} = \frac{f(x) - 4}{x - 1} = \frac{x^2 + 3x - 4}{x - 1}.$$

(d) Calculate the slope of the tangent line to the graph of  $f$  at  $A$ .

*Solution.* The slope of the tangent line to the graph of  $f$  at  $A$  is the limit as  $C$  approaches  $A$  of the slope of the line through  $A$  and  $C$  as  $C$  approaches  $A$ ,  $x$  approaches 1. Using the result of (c), we can write the slope of the tangent line to the graph of  $f$  at  $A$  as

$$\text{slope} = \lim_{x \rightarrow 1} \frac{x^2 + 3x - 4}{x - 1}.$$

To calculate this limit we use the factorization

$$x^2 + 3x - 4 = (x + 4)(x - 1).$$

Now we can calculate the limit:

$$\begin{aligned} \text{slope} &= \lim_{x \rightarrow 1} \frac{x^2 + 3x - 4}{x - 1} \\ &= \lim_{x \rightarrow 1} \frac{(x + 4)(x - 1)}{x - 1} \\ &= \lim_{x \rightarrow 1} (x + 4) \\ &= 1 + 4 \\ &= 5. \end{aligned}$$

2.

(a) Calculate the limit

$$\lim_{x \rightarrow 2} \frac{3x^2 - 15x + 18}{x - 2}.$$

*Solution* Observe that we can factor the numerator as

$$3x^2 - 15x + 18 = 3(x^2 - 5x + 6) = 3(x - 2)(x - 3).$$

This allows us to calculate the limit:

$$\begin{aligned} \lim_{x \rightarrow 2} \frac{3x^2 - 15x + 18}{x - 2} &= \lim_{x \rightarrow 2} \frac{3(x - 2)(x - 3)}{x - 2} \\ &= \lim_{x \rightarrow 2} 3(x - 3) \\ &= 3(2 - 3) \\ &= -3. \end{aligned}$$

(b) Calculate the limit

$$\lim_{x \rightarrow 2} \frac{3x^2 - 15x + 19}{x - 2}.$$

*Solution.* This limit does not exist (even as an infinite limit). First note that

$$\lim_{x \rightarrow 2^-} \frac{1}{x-2} = -\infty, \quad \text{and} \quad \lim_{x \rightarrow 2^+} \frac{1}{x-2} = +\infty.$$

Since  $\lim_{x \rightarrow 2} (3x^2 - 15x + 19) = 1$ , the limit laws (which are valid for infinite limits) tell us that

$$\begin{aligned} \lim_{x \rightarrow 2^-} \frac{3x^2 - 15x + 19}{x-2} &= \lim_{x \rightarrow 2^-} (3x^2 - 15x + 19) \lim_{x \rightarrow 2^-} \frac{1}{x-2} \\ &= \lim_{x \rightarrow 2^-} \frac{1}{x-2} \\ &= -\infty. \end{aligned}$$

The analogous calculation shows that

$$\lim_{x \rightarrow 2^+} \frac{3x^2 - 15x + 19}{x-2} = +\infty.$$

Since the left limit is not equal to the right limit, we conclude that the limit does not exist.

3. Explain whether the function

$$f(x) = \begin{cases} \frac{x^2 - 3x}{x^2 - 9} & x \neq 3 \\ 21 & x = 3 \end{cases}$$

is continuous at  $x = 3$  or not.

*Solution.* The function is continuous at  $x = 3$  if and only if  $\lim_{x \rightarrow 3} f(x) = f(3)$ . But

$$\begin{aligned} \lim_{x \rightarrow 3} \frac{x^2 - 3x}{x^2 - 9} &= \lim_{x \rightarrow 3} \frac{x(x-3)}{(x-3)(x+3)} \\ &= \lim_{x \rightarrow 3} \frac{x}{x+3} \\ &= \frac{3}{6} \\ &= \frac{1}{2}. \end{aligned}$$

Therefore the value of the limit is different from  $f(3) = 21$ ; the function is not continuous at  $x = 3$ .

4. Given the function

$$f(x) = \frac{1}{1-x} + \frac{1}{x-3} + \cos(\pi x),$$

with domain the numbers between 1 and 3,  $1 < x < 3$ .

(a) Calculate  $f(2)$ .

*Solution* Since  $\cos(2\pi) = 1$ ,

$$f(2) = \frac{1}{2-1} + \frac{1}{2-3} + \cos(2\pi) = [1 - 1] + 1 = 0 + 1 = 1.$$

(b) Is there a solution, a number  $x$  between 1 and 3, of  $f(x) = 0$ ?

*Solution* Yes. First note that

$$\begin{aligned} f(5/2) &= \frac{1}{5/2-1} + \frac{1}{5/2-3} + \cos(5\pi/2) \\ &= \frac{1}{3/2} + \frac{1}{-1/2} + 0 \\ &= \frac{2}{3} - 2 \\ &= -\frac{4}{3}. \end{aligned}$$

The function  $f$  is continuous on the closed interval  $[2, 5/2]$  and satisfies  $f(2) > 0, f(5/2) < 0$ . By the intermediate value theorem there exists a number  $x \in (2, 5/2)$  with  $f(x) = 0$ .

5. Calculate

$$\lim_{x \rightarrow \infty} \frac{3x^2 + 21}{7x^4 + 31x}.$$

*Solution* First write

$$\frac{3x^2 + 21}{7x^4 + 31x} = \frac{3x^2 + 21}{7x^4 + 31x} \cdot \frac{1/x^4}{1/x^4} = \frac{3/x^2 + 21/x^4}{7 + 31/x^3}.$$

Using the limit laws and the fact that

$$\lim_{x \rightarrow \infty} \frac{1}{x^n} = 0$$

for any positive integer  $n$ , we get

$$\begin{aligned} \lim_{x \rightarrow \infty} \frac{3x^2 + 21}{7x^4 + 31x} &= \lim_{x \rightarrow \infty} \frac{3/x^2 + 21/x^4}{7 + 31/x^3} \\ &= \frac{3 \lim_{x \rightarrow \infty} (1/x^2) + 21 \lim_{x \rightarrow \infty} (1/x^4)}{7 + 31 \lim_{x \rightarrow \infty} (1/x^3)} \\ &= \frac{3 \cdot 0 + 21 \cdot 0}{7 + 31 \cdot 0} \\ &= 0. \end{aligned}$$

6.

(a) Calculate

$$\lim_{x \rightarrow 0^+} e^{-1/x}.$$

*Solution* If  $x > 0$  then  $-1/x < 0$ , and

$$\lim_{x \rightarrow 0^+} (-1/x) = -\infty.$$

By the law for limits of compositions,

$$\lim_{x \rightarrow 0^+} e^{-1/x} = \lim_{y \rightarrow -\infty} e^y = 0.$$

(b) Calculate

$$\lim_{x \rightarrow 0^-} e^{-1/x}.$$

*Solution* If  $x < 0$  then  $-1/x > 0$  and

$$\lim_{x \rightarrow 0^-} (-1/x) = +\infty.$$

By the law for limits of compositions,

$$\lim_{x \rightarrow 0^-} e^{-1/x} = \lim_{y \rightarrow +\infty} e^y = +\infty.$$

7. Explain in words

$$\lim_{x \rightarrow \infty} f(x) = L.$$

*Solution.* This means that the values of the function  $f(x)$  can be made arbitrarily close to  $L$  by taking  $x$  sufficiently large.

8. Sketch the graph of an example of a function  $f$  which satisfies **all** the following conditions.

- $f(0) = 0$
- $f(7) = 11$
- $\lim_{x \rightarrow 7^-} f(x) = 3$
- $\lim_{x \rightarrow 7^+} f(x) = -3$
- $\lim_{x \rightarrow \infty} f(x) = 0$
- $\lim_{x \rightarrow 2^+} f(x) = \infty$
- $\lim_{x \rightarrow 2^-} f(x) = -\infty$
- $\lim_{x \rightarrow 1^+} f(x) = \infty$
- $\lim_{x \rightarrow -\infty} f(x) = -\infty$
- $f(1) = 3$
- $f(2) = 3$

Solution: One such graph is shown below. Other choices are possible, some are right, some are wrong.
