

Today's Topic: Volumes

We learnt how to calculate area, but what about volumes?

Consider: cylinder of radius r , length h .

How can we translate this into a question involving integrals?

Consider

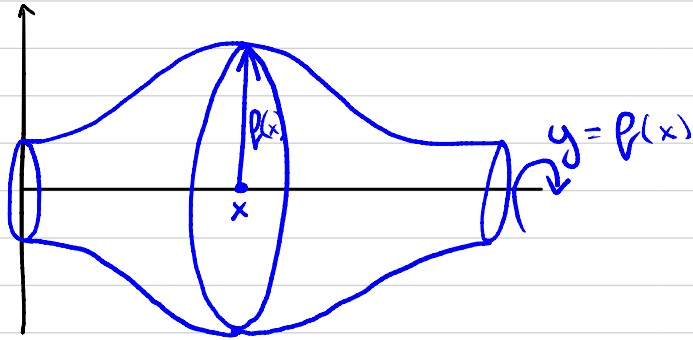

How to calculate volume?

Idea: we take a slice at each x -value, calculate the area, and add them up.

We can also use this idea for more complicated shapes:

This is called the "disk method".

$$V = \int_a^b A(x) dx$$

$A(x)$ = cross sectional area at x .

Example: Cylinder.

$$A(x) = \pi r^2.$$

$$V = \int_0^h \pi r^2 dx = \pi r^2 x \Big|_0^h \\ = \pi r^2 h.$$

In general: at each x , we get disk with radius $y = f(x)$.

$$\text{So } A(x) = \pi (f(x))^2.$$

$$\text{Thus } V = \int_a^b \pi (f(x))^2 dx.$$

Example: Find the volume of the solid obtained by rotating about the x -axis the region under the curve $y = \sqrt{x}$ from 0 to 1.

Area of each disk:

$$A(x) = \pi (f(x))^2 = \pi (\sqrt{x})^2 = \pi x.$$

$$\begin{aligned} \text{So } V &= \int_0^1 A(x) dx = \int_0^1 \pi x dx \\ &= \pi \left. \frac{x^2}{2} \right|_0^1 \\ &= \frac{\pi}{2}. \end{aligned}$$

Example: Find volume of solid obtained by rotating the region bounded by $y = x^3$, $y = 8$ and $x = 0$ about the y -axis.

We want to take horizontal slices.

Cross-sectional area:

$$A(y) = \pi (y^{1/3})^2 = \pi y^{2/3}.$$

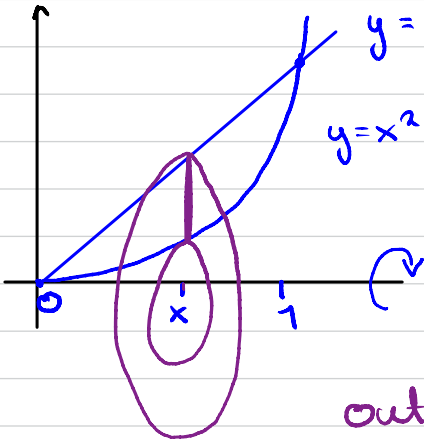

$$V = \int_a^b A(x) dx.$$

$$V = \int_a^b A(y) dy.$$

$$V = \int_0^8 \pi y^{2/3} dy$$

$$= \pi \left[\frac{3y^{5/3}}{5} \right]_0^8 = \frac{96\pi}{5}.$$

Example: Find the volume of the solid obtained by rotating the area enclosed by $y = x$; $y = x^2$ about the x -axis

Each slice:

outer radius = x

inner radius = x^2 .

$A(x) =$ area of outer disk - area of inner disk.

$$= \pi x^2 - \pi (x^2)^2$$

$$= \pi (x^2 - x^4).$$

$$V = \int_a^b A(x) dx$$

$$= \int_0^1 \pi (x^2 - x^4) dx$$

$$= \pi \left[\frac{x^3}{3} - \frac{x^5}{5} \right]_0^1$$

$$= \frac{2\pi}{15}.$$
