# Abstract of the Dissertation <br> Two-Point Gromov-Witten Formulas for Symplectic Toric Manifolds 

by<br>Alexandra Mihaela Popa<br>Doctor of Philosophy

in

## Mathematics

Stony Brook University

2012

We show that the standard generating functions for genus 0 two-point twisted GromovWitten invariants arising from concavex vector bundles over symplectic toric manifolds are explicit transforms of the corresponding one-point generating functions. The latter are, in turn, transforms of Givental's $J$-function. We obtain closed formulas for them and, in particular, for two-point Gromov-Witten invariants of non-negative toric complete intersections. Such two-point formulas should play a key role in the computation of genus 1 Gromov-Witten invariants (closed, open, and unoriented) of toric complete intersections as they indeed do in the case of the projective complete intersections.

Remarks 3.2, 4.2

## Ackowledgements

I am indebted to Aleksey Zinger for teaching me localization techniques and for suggesting all the questions that I have worked on so far. I thank him for his thorough comments on and corrections of countless drafts of my papers, in particular this dissertation. He spent a very generous amount of time on my mathematical guidance and shared his Gromov-Witten expertise and talent in many discussions with me; I am very grateful.

I thank Melissa Liu for explaining parts of Givental's work needed for this dissertation, for her answers to my questions on toric manifolds, and for an inspiring discussion about a preliminary stage of the results in this dissertation.

I am indebted to Iulică Popa, my teacher, for over twenty years of wonderful lessons of mathematics and guidance. In particular, I thank him for the computations without paper and pen and the discovery-type problems in my childhood, and for his teaching me in high school the proofs of the fundamentals ahead of the time they were taught in class.

I thank Professor Starr for his advice, support, and help over the past four years at Stony Brook.

I thank both of my parents, my grannie, and my sister for supporting my study of mathematics in so many ways.

## Chapter 1

## Introduction

Torus actions on moduli spaces of stable maps into a smooth projective variety facilitate the computation of equivariant Gromov-Witten invariants [Gi1] via the Localization Theorem [ABo], [GraPa]. Equivariant formulas lead to other interesting consequences beyond the computation of non-equivariant Gromov-Witten invariants. In the case of the projective spaces, two-point equivariant Gromov-Witten formulas in [PZZ lead to the confirmation of mirror symmetry predictions concerning open and unoriented genus 1 Gromov-Witten invariants in the same paper and to the computation of closed genus 1 Gromov-Witten invariants in [Po]. In this dissertation we obtain equivariant formulas expressing the standard two-point closed genus 0 generating function for certain twisted Gromov-Witten invariants of symplectic toric manifolds in terms of the corresponding one-point generating functions. We also obtain explicit formulas for the latter. In particular, we show that the standard generating function for these two-point invariants is a fairly simple transform of the well-known Givental's $J$-function. The formulas obtained in this dissertation compute, in particular, the twisted/un-twisted Gromov-Witten numbers (1.2) / (1.3) below.

For a smooth projective variety $X$ and a class $A \in H_{2}(X ; \mathbb{Z}), \overline{\mathfrak{M}}_{0, m}(X, A)$ denotes the moduli space of stable maps from genus 0 curves with $m$ marked points into $X$ representing $A$. Let

$$
\mathrm{ev}_{i}: \overline{\mathfrak{M}}_{0, m}(X, A) \longrightarrow X
$$

be the evaluation map at the $i$-th marked point; see [MirSym, Chapter 24]. All cohomology groups in this dissertation will be with rational coefficients unless otherwise specified. For each $i=1,2, \ldots, m$, let $\psi_{i} \in H^{2}\left(\overline{\mathfrak{M}}_{0, m}(X, A)\right)$ be the first Chern class of the universal cotangent line bundle for the $i$-th marked point. Let

$$
\pi: \mathfrak{U} \longrightarrow \overline{\mathfrak{M}}_{0, m}(X, A)
$$

be the universal curve and ev: $\mathfrak{U} \longrightarrow X$ the natural evaluation map; see MirSym, Section 24.3].

A holomorphic vector bundle $E \longrightarrow X$ is called concavex if

$$
E=E^{+} \oplus E^{-}, \quad \text { with } \quad H^{1}\left(\mathbb{P}^{1}, f^{*} E^{+}\right)=0, \quad H^{0}\left(\mathbb{P}^{1}, f^{*} E^{-}\right)=0 \quad \forall f: \mathbb{P}^{1} \longrightarrow X
$$

Such a vector bundle induces a vector orbi-bundle $\mathcal{V}_{E}$ over $\overline{\mathfrak{M}}_{0, m}(X, A)$ :

$$
\begin{equation*}
\mathcal{V}_{E} \equiv \mathcal{V}_{E^{+}} \oplus \mathcal{V}_{E^{-}}, \quad \text { where } \quad \mathcal{V}_{E^{+}} \equiv \pi_{*} \mathrm{ev}^{*} E^{+}, \quad \mathcal{V}_{E^{-}} \equiv R^{1} \pi_{*} \mathrm{ev}^{*} E^{-} \tag{1.1}
\end{equation*}
$$

Given a class $A \in H_{2}(X ; \mathbb{Z})$ and classes $\eta_{1}, \eta_{2} \in H^{*}(X)$, the corresponding genus 0 twisted two-point Gromov-Witten (GW) invariants of $X$ are:

$$
\begin{equation*}
\left\langle\psi^{p_{1}} \eta_{1}, \psi^{p_{2}} \eta_{2}\right\rangle_{A, E}^{X} \equiv \int_{\left[\overline{\mathfrak{M}}_{0,2}(X, A)\right]^{\text {vir }}}\left(\psi_{1}^{p_{1}} \operatorname{ev}_{1}^{*} \eta_{1}\right)\left(\psi_{2}^{p_{2}} \operatorname{ev}_{2}^{*} \eta_{2}\right) e\left(\mathcal{V}_{E}\right) \in \mathbb{Q} . \tag{1.2}
\end{equation*}
$$

In particular, if $E=E^{+}$, the twisted Gromov-Witten invariants (1.2) are the genus 0 twopoint Gromov-Witten invariants of a complete intersection $Y \equiv s^{-1}(0) \hookrightarrow X$ defined by a generic holomorphic section $s: X \longrightarrow E^{+}$:

$$
\begin{equation*}
\left\langle\psi^{p_{1}} \eta_{1}, \psi^{p_{2}} \eta_{2}\right\rangle_{A, E^{+}}^{X}=\left\langle\psi^{p_{1}} \eta_{1}, \psi^{p_{2}} \eta_{2}\right\rangle_{A}^{Y} \equiv\left\langle\psi^{p_{1}} \eta_{1}, \psi^{p_{2}} \eta_{2}\right\rangle_{A, 0}^{Y} \quad \forall \eta_{1}, \eta_{2} \in H^{*}(Y) ; \tag{1.3}
\end{equation*}
$$

the first equality follows from [El, Theorem 0.1.1, Remark 0.1.1].
The numbers (1.2) have been computed in the $X=\mathbb{P}^{n-1}$ case under various assumptions on $E$ through various approaches. The case when $E$ is a positive line bundle is solved in $[\mathrm{BK}]$ and $[\mathrm{Z1}]$ and extended to the case when $E$ is a sum of positive line bundles in [PoZ]. The former led to the computation of the genus 1 Gromov-Witten invariants of Calabi-Yau hypersurfaces in [Z2], while the latter to the computation of the genus 1 Gromov-Witten invariants of Calabi-Yau complete intersections in [Po]. The case when $E$ is a concavex vector bundle has been solved in [Ch] in the setting of [LY1]. More recently, genus 0 formulas with any number of $\psi$ classes have been obtained in [Z3]. In this dissertation we extend the approaches of [Z1] and [PoZ] to the case when $X$ is an arbitrary compact symplectic toric manifold and $E$ is a sum of non-negative and negative line bundles.

### 1.1 Some results

If $n$ is a non-negative integer, we write

$$
[n] \equiv\{1,2, \ldots, n\} .
$$

Let $s \geqslant 1, N_{1}, \ldots, N_{s} \geqslant 2$ and for each $i \in[s]$ let

$$
\mathrm{H}_{i} \equiv \mathrm{pr}_{i}^{*} \mathrm{H} \in H^{2}\left(\prod_{j=1}^{s} \mathbb{P}^{N_{j}-1}\right)
$$

where $\operatorname{pr}_{i}: \prod_{j=1}^{s} \mathbb{P}^{N_{j}-1} \longrightarrow \mathbb{P}^{N_{i}-1}$ is the projection onto the $i$-th component and $\mathrm{H} \in H^{2}\left(\mathbb{P}^{N_{i}-1}\right)$ is the hyperplane class on $\mathbb{P}^{N_{i}-1}$.
Theorem 1.1. Let $\mathbf{d}=\left(d_{1}, \ldots, d_{s}\right) \in\left(\mathbb{Z}^{>0}\right)^{s}$. The degree $\mathbf{d}$ genus 0 two-point $G W$ invariants (1.3) of $\prod_{i=1}^{s} \mathbb{P}^{N_{i}-1}$ are given by the following identity in $\frac{\mathbb{Q}\left[\mathrm{A}_{1}, \ldots, \mathrm{~A}_{s}, \mathrm{~B}_{1}, \ldots, \mathrm{~B}_{s}\right]}{\left(\mathrm{A}_{i}^{N_{i}}, \mathrm{~B}_{i}^{N_{i}} \quad \forall i \in[s]\right)}\left[\left[\hbar_{1}^{-1}, \hbar_{2}^{-1}\right]\right]$ :

$$
\begin{align*}
\sum_{\substack{a_{1}, \ldots, a_{s} \geqslant 0 \\
b_{1}, \ldots, b_{s} \geqslant 0}} \mathrm{~A}_{1}^{a_{1}} \ldots \mathrm{~A}_{s}^{a_{s}} \mathrm{~B}_{1}^{b_{1}} \ldots \mathrm{~B}_{s}^{b_{s}}
\end{align*} \frac{\mathrm{H}_{1}^{N_{1}-1-a_{1}} \ldots \mathrm{H}_{s}^{N_{s}-1-a_{s}}}{\hbar_{1}-\psi}, \frac{\mathrm{H}_{1}^{N_{1}-1-b_{1}} \ldots \mathrm{H}_{s}^{N_{s}-1-b_{s}}}{\hbar_{2}-\psi} \prod_{\mathrm{d}}^{\prod_{i=1}^{s}} \mathbb{P}^{N_{i}-1} .
$$

This follows from Corollary 3.8 in Section 3.2.
Remark 1.2. The sums on both sides of (1.4) are power series in $\hbar_{1}^{-1}$ and $\hbar_{2}^{-1}$. In order to see that this is the case for the right-hand side of (1.4), divide both the numerator and denominator of each $a_{i}, b_{i}, e_{i}, f_{i}$-summand by $\hbar_{1}^{\sum_{i=1}^{s} N_{i} e_{i}} \hbar_{2}^{s=1} N_{i}^{s} f_{i}$. Part of the statement of Theorem 1.1 is that the right-hand side sum in (1.4) is divisible by $\hbar_{1}+\hbar_{2}$ (i.e. it vanishes when evaluated at $\left.\left(\hbar_{1}, \hbar_{2}\right)=(\hbar,-\hbar)\right)$. Identity (1.4) should be interpreted by first dividing this sum by $\hbar_{1}+\hbar_{2}$ and then setting it equal to the left-hand side.

The results below concern the GW invariants of a compact symplectic toric manifold $X_{M}^{\tau}$ defined by (2.2) from a minimal toric pair $(M, \tau)$ as in Definition 2.1. We assume that the vector bundle $E$ splits

$$
\begin{equation*}
E \equiv E^{+} \oplus E^{-} \longrightarrow X_{M}^{\tau}, \quad \text { where } \quad E^{+} \equiv \bigoplus_{i=1}^{a} L_{i}^{+}, \quad E^{-} \equiv \bigoplus_{i=1}^{b} L_{i}^{-} \tag{1.5}
\end{equation*}
$$

$L_{i}^{+}$are non-trivial, non-negative line bundles and $L_{i}^{-}$are negative line bundles ${ }^{1}$ Theorem 1.3 and Remark 1.4 below describe two-point twisted GW invariants in terms of one-point ones. As is usually done, the twisted GW invariants will be assembled into a generating function in the formal variables

$$
Q=\left(Q_{1}, \ldots, Q_{k}\right)
$$

with powers indexed by

$$
\begin{equation*}
\Lambda \equiv\left\{\mathbf{d} \in H_{2}\left(X_{M}^{\tau} ; \mathbb{Z}\right):\langle\omega, \mathbf{d}\rangle \geqslant 0 \quad \forall \omega \in \overline{\mathcal{K}}_{M}^{\tau}\right\} \tag{1.6}
\end{equation*}
$$

where $\overline{\mathcal{K}}_{M}^{\tau}$ is the closed Kähler cone of $X_{M}^{\tau} \cdot$ :
A ring $R$ and the monoid $\Lambda$ induce an $R$-algebra denoted $R[[\Lambda]]$ : to each $\mathbf{d}$ we associate a basis element denoted $Q^{\mathrm{d}}$ and set

$$
R[[\Lambda]] \equiv\left\{\sum_{\mathbf{d} \in \Lambda} a_{\mathbf{d}} Q^{\mathbf{d}}: a_{\mathbf{d}} \in R \quad \forall \mathbf{d} \in \Lambda\right\}
$$

Addition in $R[[\Lambda]]$ is defined naturally; multiplication is defined by

$$
Q^{\mathrm{d}} \cdot Q^{\mathrm{d}^{\prime}} \equiv Q^{\mathrm{d}+\mathrm{d}^{\prime}} \quad \forall \mathbf{d}, \mathbf{d}^{\prime} \in \Lambda
$$

[^0]and extended by $R$-linearity.
For each $m \geqslant 1$ and each $\mathbf{d} \in \Lambda-\{0\}$, let $\sigma_{i}: \overline{\mathfrak{M}}_{0, m}\left(X_{M}^{\tau}, \mathbf{d}\right) \longrightarrow \mathfrak{U}$ be the section of the universal curve given by the $i$-th marked point,
\[

$$
\begin{align*}
& \dot{\mathcal{V}}_{E} \equiv R^{0} \pi_{*}\left(\mathrm{ev}^{*} E^{+}\left(-\sigma_{1}\right)\right) \oplus R^{1} \pi_{*}\left(\mathrm{ev}^{*} E^{-}\left(-\sigma_{1}\right)\right) \longrightarrow \overline{\mathfrak{M}}_{0, m}\left(X_{M}^{\tau}, \mathbf{d}\right), \quad \text { and } \\
& \ddot{\mathcal{V}}_{E} \equiv R^{0} \pi_{*}\left(\mathrm{ev}^{*} E^{+}\left(-\sigma_{2}\right)\right) \oplus R^{1} \pi_{*}\left(\mathrm{ev}^{*} E^{-}\left(-\sigma_{2}\right)\right) \longrightarrow \overline{\mathfrak{M}}_{0, m}\left(X_{M}^{\tau}, \mathbf{d}\right) \quad \text { whenever } m \geqslant 2 . \tag{1.7}
\end{align*}
$$
\]

If $m \geqslant 3$ and $\mathbf{d}=0, \dot{\mathcal{V}}_{E}$ and $\ddot{\mathcal{V}}_{E}$ are well-defined as well and they are 0 . We next define the genus 0 two-point generating function $\dot{Z}$ :

$$
\begin{equation*}
\dot{Z}\left(\hbar_{1}, \hbar_{2}, Q\right) \equiv \frac{\hbar_{1} \hbar_{2}}{\hbar_{1}+\hbar_{2}} \sum_{\mathbf{d} \in \Lambda} Q^{\mathrm{d}}\left(\mathrm{ev}_{1} \times \mathrm{ev}_{2}\right)_{*}\left[\frac{e\left(\dot{\mathcal{V}}_{E}\right)}{\left(\hbar_{1}-\psi_{1}\right)\left(\hbar_{2}-\psi_{2}\right)}\right], \tag{1.8}
\end{equation*}
$$

where $\mathrm{ev}_{1}, \mathrm{ev}_{2}: \overline{\mathfrak{M}}_{0,3}\left(X_{M}^{\tau}, \mathbf{d}\right) \longrightarrow X_{M}^{\tau}$ are the evaluation maps at the first two marked points. This is used - in the case of the projective spaces - for the computation of the genus 1 GW invariants of Calabi-Yau complete intersections.

With $\mathrm{ev}_{1}, \mathrm{ev}_{2}: \overline{\mathfrak{M}}_{0,2}\left(X_{M}^{\tau}, \mathbf{d}\right) \longrightarrow X_{M}^{\tau}$ denoting the evaluation maps at the two marked points and for all $\eta \in H^{2}\left(X_{M}^{\tau}\right)$, let

$$
\begin{align*}
& \dot{Z}_{\eta}(\hbar, Q) \equiv \eta+\sum_{\mathrm{d} \in \Lambda-0} Q^{\mathrm{d}} \mathrm{ev}_{1 *}\left[\frac{e\left(\dot{\mathcal{V}}_{E}\right) \mathrm{ev}_{2}^{*} \eta}{\hbar-\psi_{1}}\right] \in H^{*}\left(X_{M}^{\tau}\right)\left[\hbar^{-1}\right][[\Lambda]], \\
& \ddot{Z}_{\eta}(\hbar, Q) \equiv \eta+\sum_{\mathrm{d} \in \Lambda-0} Q^{\mathrm{d}} \mathrm{ev}_{1 *}\left[\frac{e\left(\ddot{\mathcal{V}}_{E}\right) \mathrm{ev}_{2}^{*} \eta}{\hbar-\psi_{1}}\right] \in H^{*}\left(X_{M}^{\tau}\right)\left[\hbar^{-1}\right][[\Lambda]] . \tag{1.9}
\end{align*}
$$

Theorem 1.3. Let $\mathrm{pr}_{i}: X_{M}^{\tau} \times X_{M}^{\tau} \longrightarrow X_{M}^{\tau}$ denote the projection onto the $i$-th component and let $\eta_{j}, \check{\eta}_{j} \in H^{*}\left(X_{M}^{\tau}\right)$ be such that

$$
\sum_{j=1}^{s} \operatorname{pr}_{1}^{*} \eta_{j} \operatorname{pr}_{2}^{*} \check{\eta}_{j} \in H^{2(N-k)}\left(X_{M}^{\tau} \times X_{M}^{\tau}\right)
$$

is the Poincaré dual to the diagonal class, where $N-k$ is the complex dimension of $X_{M}^{\tau}$. Then,

$$
\dot{Z}\left(\hbar_{1}, \hbar_{2}, Q\right)=\frac{1}{\hbar_{1}+\hbar_{2}} \sum_{j=1}^{s} \operatorname{pr}_{1}^{*} \dot{Z}_{\eta_{j}}\left(\hbar_{1}, Q\right) \operatorname{pr}_{2}^{*} \ddot{Z}_{\dddot{\eta}_{j}}\left(\hbar_{2}, Q\right) .
$$

This follows from Theorem 4.5 below, which is an equivariant version of Theorem 1.3,
Remark 1.4. The genus 0 two-point twisted GW invariants (1.2) are assembled into

$$
\begin{equation*}
Z^{*}\left(\hbar_{1}, \hbar_{2}, Q\right) \equiv \sum_{\mathbf{d} \in \Lambda-0} Q^{\mathbf{d}}\left(\mathrm{ev}_{1} \times \mathrm{ev}_{2}\right)_{*}\left[\frac{e\left(\mathcal{V}_{E}\right)}{\left(\hbar_{1}-\psi_{1}\right)\left(\hbar_{2}-\psi_{2}\right)}\right] \tag{1.10}
\end{equation*}
$$

where $\mathrm{ev}_{1}, \mathrm{ev}_{2}: \overline{\mathfrak{M}}_{0,2}\left(X_{M}^{\tau}, \mathbf{d}\right) \longrightarrow X_{M}^{\tau}$. By the string relation MirSym, Section 26.3],
$Z^{*}\left(\hbar_{1}, \hbar_{2}, Q\right)=\frac{\hbar_{1} \hbar_{2}}{\hbar_{1}+\hbar_{2}} \sum_{\mathbf{d} \in \Lambda-0}\left(\mathrm{ev}_{1} \times \mathrm{ev}_{2}\right)_{*}\left[\frac{e\left(\mathcal{V}_{E}\right)}{\left(\hbar_{1}-\psi_{1}\right)\left(\hbar_{2}-\psi_{2}\right)}\right] \in H^{*}\left(X_{M}^{\tau} \times X_{M}^{\tau}\right)\left[\hbar_{1}^{-1}, \hbar_{2}^{-1}\right][[\Lambda]]$,
where $\mathrm{ev}_{1}, \mathrm{ev}_{2}: \overline{\mathfrak{M}}_{0,3}\left(X_{M}^{\tau}, \mathbf{d}\right) \longrightarrow X_{M}^{\tau}$. By (1.7) and (1.1),

$$
e\left(\dot{\mathcal{V}}_{E}\right) \operatorname{ev}_{1}^{*} e\left(E^{+}\right)=e\left(\mathcal{V}_{E}\right) \operatorname{ev}_{1}^{*} e\left(E^{-}\right)
$$

The last two equations imply that

$$
\dot{Z}^{*}\left(\hbar_{1}, \hbar_{2}, Q\right) \operatorname{pr}_{1}^{*} e\left(E^{+}\right)=Z^{*}\left(\hbar_{1}, \hbar_{2}, Q\right) \operatorname{pr}_{1}^{*} e\left(E^{-}\right),
$$

where $\dot{Z}^{*}$ is obtained from $\dot{Z}$ by disregarding the $Q^{\mathbf{0}}$ term and $\mathrm{pr}_{1}: X_{M}^{\tau} \times X_{M}^{\tau} \longrightarrow X_{M}^{\tau}$ is the projection onto the first component. This together with Theorem 1.3 expresses $Z^{*}$ in terms of $\dot{Z}_{\eta}, \ddot{Z}_{\eta}$ in the $E=E^{+}$case. In all other cases, $Z^{*}$ can be expressed in terms of onepoint GW generating functions which can be computed under one additional assumption; see Remark 3.9,

Remark 1.5. If $E=\mathcal{O}_{\mathbb{P}^{2}}(-1) \oplus \mathcal{O}_{\mathbb{P}^{2}}(-2)$ and $\mathrm{H} \in H^{2}\left(\mathbb{P}^{2}\right)$ is the hyperplane class, then

$$
\int_{\overline{\mathfrak{M}}_{0,2}\left(\mathbb{P}^{2}, d\right)} e\left(\mathcal{V}_{E}\right) \operatorname{ev}_{1}^{*} \mathrm{H}^{2} \mathrm{ev}_{2}^{*} \mathrm{H}=\int_{\overline{\mathfrak{M}}_{0,2}\left(\mathbb{P}^{2}, d\right)} e\left(\mathcal{V}_{E}\right) \operatorname{ev}_{1}^{*} \operatorname{Hev}_{2}^{*} \mathrm{H}^{2}=(-1)^{d} \frac{(2 d)!}{2 d(d!)^{2}} \quad \forall d \geqslant 1 .
$$

If $E=\mathcal{O}_{\mathbb{P}^{2}}(-1) \oplus \mathcal{O}_{\mathbb{P}^{2}}(-1) \oplus \mathcal{O}_{\mathbb{P}^{2}}(-1)$ and $\mathrm{H} \in H^{2}\left(\mathbb{P}^{2}\right)$ is the hyperplane class, then

$$
\int_{\overline{\mathfrak{M}}_{0,2}\left(\mathbb{P}^{2}, d\right)} e\left(\mathcal{V}_{E}\right) \operatorname{ev}_{1}^{*} \mathrm{H}^{2} \mathrm{ev}_{2}^{*} \mathrm{H}^{2}=\frac{(-1)^{d+1}}{d} \quad \forall d \geqslant 1 .
$$

If $E=\mathcal{O}_{\mathbb{P}^{1}}(-1) \oplus \mathcal{O}_{\mathbb{P}^{1}}(-1)$ and $\mathrm{H} \in H^{2}\left(\mathbb{P}^{1}\right)$ is the hyperplane class, then

$$
\int_{\overline{\mathfrak{M}}_{0,2}\left(\mathbb{P}^{1}, d\right)} e\left(\mathcal{V}_{E}\right) \mathrm{ev}_{1}^{*} \mathrm{Hev}_{2}^{*} \mathrm{H}=\frac{1}{d} \quad \forall d \geqslant 1 .
$$

These follow from (3.36) in Section 3.2 which relies on Theorem 4.5, the equivariant version of Theorem 1.3 above. The first of these equations implies the first statement in $[\mathrm{KlPa}$, Proposition 2] by the divisor relation of [MirSym, Section 26.3], the second recovers the first statement in PaZ , Lemma 3.1], and the third implies the Aspinwall-Morrison formula.

### 1.2 Outline of the dissertation

Chapter 2 presents the facts about symplectic toric manifolds needed for the GromovWitten theory parts of the dissertation. These are Proposition 2.2 and Remark 2.10 in Section [2.1, Propositions 2.14, 2.16, and 2.17 in Section 2.2, and Corollary 2.20 and Proposition [2.21 in Section [2.3. This chapter is inspired by the view in [Gi2] of a symplectic toric manifold as given by a matrix and the choice of a certain regular value together with the holomorphic charts of [Ba]. It contains proofs of all statements or references to the ones that are omitted. The reader interested only in the Gromov-Witten theory part may want to skip all proofs in Chapter 2.

Section 3.2 gives formulas for the one-point GW generating functions $\dot{Z}_{\eta}, \dddot{Z}_{\eta}$ of (1.9) under an additional assumption in terms of explicit formal power series constructed in Section 3.1. It begins with a short setup.

The explicit GW formulas of Section 3.2 and Theorem 1.3 above follow from the equivariant statements of Section 4.2. In particular, equivariant versions of $\dot{Z}_{\eta}$ and $\ddot{Z}_{\eta}$ are expressed in terms of explicit power series constructed in Section 4.1. Chapter 4 also begins with a short setup.

An outline of the proofs of the equivariant theorems of Section 4.2 is given in Section 5.1. The remaining sections of Chapter 5 provide the details.

## Chapter 2

## Overview of symplectic toric manifolds

This chapter reviews the basics of symplectic toric manifolds and sets up notation that will be used throughout the rest of the dissertation. It combines the perspectives of Au, Chapter VII], [McDSa, Section 11.3], [Ba, Section 2], [CK, Section 3.3.4], [Gi2], [Gi3], and [Sp, Sections 5,6].

Sections 2.1-2.2 give the definition and describe the basic properties of a compact symplectic toric manifold. Section 2.3 is a preparation for localization computations in a toric setting; it describes the fixed points and curves and the equivariant cohomology.

### 2.1 Definition, charts, and Kähler classes

Throughout this dissertation, $k$ and $N$ denote fixed positive integers such that $k \leqslant N$ and

$$
[N] \equiv\{1,2, \ldots, N\}
$$

If $v \in \mathbb{R}^{k}$ (or $v \in \mathbb{C}^{N}$ ) and $j \in[k]$ (or $j \in[N]$ ), let $v_{j} \in \mathbb{R}$ (or $v_{j} \in \mathbb{C}$ ) denote the $j$-th component of $v$ and define

$$
\operatorname{supp}(v) \equiv\left\{j: v_{j} \neq 0\right\} .
$$

If $J \subseteq[N]$, let

$$
\mathbb{R}^{J} \equiv\left\{v \in \mathbb{R}^{N}: \operatorname{supp}(v) \subseteq J\right\} \cong \mathbb{R}^{|J|}, \quad \mathbb{C}^{J} \equiv\left\{z \in \mathbb{C}^{N}: \operatorname{supp}(z) \subseteq J\right\} \cong \mathbb{C}^{|J|}
$$

If $A=\left(a_{i j}\right)_{i \in[k], j \in[N]}$ is a $k \times N$ matrix and $J \subseteq[N]$, denote by $A_{J}$ the $k \times|J|$ submatrix of $A$ consisting of the columns indexed by the elements of $J$. Let

$$
\omega_{\text {std }} \equiv \frac{\mathrm{i}}{2} \sum_{j=1}^{N} \mathrm{~d} z_{j} \wedge \mathrm{~d} \bar{z}_{j}
$$

be the standard symplectic form on $\mathbb{C}^{N}$. Let

$$
\mu_{\mathrm{std}}: \mathbb{C}^{N} \longrightarrow \mathbb{R}^{N}, \quad \mu_{\mathrm{std}}\left(z_{1}, \ldots, z_{N}\right) \equiv\left(\left|z_{1}\right|^{2}, \ldots,\left|z_{N}\right|^{2}\right)
$$

be the moment map for the restriction of the standard action of $\mathbb{T}^{N} \equiv\left(\mathbb{C}^{*}\right)^{N}$ on $\left(\mathbb{C}^{N},-2 \omega_{\text {std }}\right)$,

$$
\left(t_{1}, \ldots, t_{N}\right) \cdot\left(z_{1}, \ldots, z_{N}\right)=\left(t_{1} z_{1}, \ldots, t_{N} z_{N}\right)
$$

to $\left(S^{1}\right)^{N} \subset \mathbb{T}^{N}$.
An integer $k \times N$ matrix $M=\left(m_{i j}\right)_{i \in[k], j \in[N]}$ induces an action of $\mathbb{T}^{k} \equiv\left(\mathbb{C}^{*}\right)^{k}$ on $\left(\mathbb{C}^{N},-2 \omega_{\text {std }}\right)$,

$$
\begin{equation*}
\left(t_{1}, \ldots, t_{k}\right) \cdot\left(z_{1}, \ldots, z_{N}\right)=\left(t_{1}^{m_{11}} t_{2}^{m_{21}} \ldots t_{k}^{m_{k 1}} z_{1}, \ldots, t_{1}^{m_{1 N}} t_{2}^{m_{2 N}} \ldots t_{k}^{m_{k N}} z_{N}\right) \tag{2.1}
\end{equation*}
$$

the moment map of its restriction to $\left(S^{1}\right)^{k} \subset \mathbb{T}^{k}$ is

$$
\mu_{M} \equiv M \circ \mu_{\mathrm{std}}: \mathbb{C}^{N} \longrightarrow \mathbb{R}^{k}
$$

If in addition $\tau \in \mathbb{R}^{k}$, let

$$
\begin{align*}
P_{M}^{\tau} & \equiv M^{-1}(\tau) \cap\left(\mathbb{R}^{\geqslant 0}\right)^{N}, \\
\tilde{X}_{M}^{\tau} \equiv \mathbb{C}^{N}-\bigcup_{\substack{J \subseteq N] \\
\mathbb{C}^{J} \cap \mu_{M}^{-1}(\tau)=\varnothing}} \mathbb{C}^{J} & =\left\{z \in \mathbb{C}^{N}: \mathbb{C}^{\operatorname{supp}(z)} \cap \mu_{M}^{-1}(\tau) \neq \varnothing\right\}, \quad X_{M}^{\tau} \equiv \widetilde{X}_{M}^{\tau} / \mathbb{T}^{k} ; \tag{2.2}
\end{align*}
$$

see diagram (2.3). By Proposition 2.2 below, $X_{M}^{\tau}$ is a compact projective manifold if the pair $(M, \tau)$ is toric in the sense of Definition 2.1. In this case, $\mu_{\text {std }}^{-1}\left(P_{M}^{\tau}\right) /\left(S^{1}\right)^{k}$ has a unique smooth structure making the projection

$$
\mu_{\mathrm{std}}^{-1}\left(P_{M}^{\tau}\right) \longrightarrow \mu_{\mathrm{std}}^{-1}\left(P_{M}^{\tau}\right) /\left(S^{1}\right)^{k}
$$

a submersion. With this smooth structure, $\mu_{\mathrm{std}}^{-1}\left(P_{M}^{\tau}\right) /\left(S^{1}\right)^{k}$ is diffeomorphic to $X_{M}^{\tau}$ via a diffeomorphism induced by the inclusion $\mu_{\text {std }}^{-1}\left(P_{M}^{\tau}\right) \hookrightarrow \widetilde{X}_{M}^{\tau}$. We summarize this setup in a diagram:

Given a pair $(M, \tau)$ consisting of an integer $k \times N$ matrix $M$ and a vector $\tau \in \mathbb{R}^{k}$, we define

$$
\begin{align*}
\mathscr{V}_{M}^{\tau} & \equiv\left\{J \subseteq[N]:|J|=k, P_{M}^{\tau} \cap \mathbb{R}^{J} \neq \varnothing\right\} \\
& \equiv\left\{J \subseteq[N]:|J|=k, \exists v \in M^{-1}(\tau) \cap\left(\mathbb{R}^{\geqslant 0}\right)^{N} \text { s.t. } \operatorname{supp}(v) \subseteq J\right\} . \tag{2.4}
\end{align*}
$$

Definition 2.1. A pair $(M, \tau)$ consisting of an integer $k \times N$ matrix $M$ and a vector $\tau \in \mathbb{R}^{k}$ is toric if
(i) $\tau$ is a regular value of $\mu_{M}$ and $P_{M}^{\tau} \neq \varnothing$;
(ii) $\operatorname{det} M_{J} \in\{ \pm 1\}$ for all $J \in \mathscr{V}_{M}^{\tau}$;
(iii) $P_{M}^{0}=\{0\}\left(\Longleftrightarrow P_{M}^{\tau}\right.$ is bounded).

A toric pair $(M, \tau)$ is minimal if
(iv) $P_{M}^{\tau} \cap \mathbb{R}^{[N]-\{j\}} \neq \varnothing$ for all $j \in[N]$.

If a pair $(M, \tau)$ satisfies (ii) in Definition 2.1 above, then

$$
z \in \mathbb{C}^{N}, \operatorname{supp}(z) \supseteq J \quad \text { for some } \quad J \in \mathscr{V}_{M}^{\tau} \Longrightarrow \exists t \in \mathbb{T}^{k} \quad \text { such that } \quad(t \cdot z)_{j}=1 \quad \forall j \in J .
$$

If $(M, \tau)$ is a toric pair, then a point $z \in \mathbb{C}^{N}$ lies in $\widetilde{X}_{M}^{\tau}$ if and only if $\operatorname{supp}(z) \supseteq J$ for some $J \in \mathscr{V}_{M}^{\tau}$ and the $\mathbb{T}^{N}$-fixed points of $X_{M}^{\tau}$ are indexed by $\mathscr{V}_{M}^{\tau}$; see Lemma 2.4] (i) and Corollary 2.2q(a).

Proposition 2.2. If $(M, \tau)$ is a toric pair, then $X_{M}^{\tau}$ is a connected compact projective manifold of complex dimension $N-k$ endowed with a $\mathbb{T}^{N}$-action induced from the standard action of $\mathbb{T}^{N}$ on $\mathbb{C}^{N}$.

Proof of Proposition 2.2. By Lemmas 2.5) (a), (g), and (h) below, $X_{M}^{\tau}$ is a connected, compact complex manifold. It admits a positive line bundle by Lemmas 2.13, 2.7) b), and 2.9 below. By the Kodaira Embedding Theorem [GriH, p181], $X_{M}^{\tau}$ is then projective.

Remark 2.3. If $X$ is a compact symplectic toric manifold in the sense of Ca , Definition I.1.15], then the image of its moment map is a Delzant polytope $P$ (a polytope with certain properties [Ca, Definition I.2.1]); see [At, Theorem 1] or [GuS, Theorem 5.2]. This polytope $P$ determines a fan $\Sigma_{P}$, which in turn determines a compact complex manifold $X_{\Sigma_{P}}$; see [Au, Section VII.1.ac]. This complex manifold $X_{\Sigma_{P}}$ is endowed with a symplectic form, a torus action, and a moment map with image $P$ making it into a symplectic toric manifold; see [Au, Theorem VII.2.1]. Moreover, this symplectic form is Kähler with respect to the complex structure, as stated in [Gi2, Section 3] and can be deduced from [Au, Chapter VII]. Since $X$ and $X_{\Sigma_{P}}$ have the same moment polytope (i.e. image of the moment map), they are isomorphic as symplectic toric manifolds by Delzant's uniqueness theorem [De, Theorem 2.1]. On the other hand, $X_{\Sigma_{P}}=X_{M}^{\tau}$ for some minimal toric pair ( $M, \tau$ ) by the proof of Au, Theorem VII.2.1]. Thus, a compact symplectic toric manifold $\left(X^{2 n}, \omega,\left(S^{1}\right)^{n}, \mu\right)$ in the sense of [Ca, Definition I.1.15] admits a complex structure $\mathcal{J}$ so that $(X, \omega, \mathcal{J})$ is Kähler and $(X, \mathcal{J})$ is isomorphic to $X_{M}^{\tau}$ for some minimal toric pair $(M, \tau)$.

Lemma 2.5 relies on parts $(i)$ and $(j)$ of Lemma 2.4 below which in turn rely on the other parts of Lemma 2.4. Lemma 2.9 is based on Lemma 2.8 and Lemma 2.7) (d), Lemma 2.7(b) follows from Lemma 2.7 $(a)$, while the proof of Lemma 2.7] $(d)$ uses Lemma [2.7 $(c)$.

For $t=\left(t_{1}, t_{2}, \ldots, t_{k}\right) \in \mathbb{T}^{k}$ and $\mathbf{p}=\left(p_{1}, p_{2}, \ldots, p_{k}\right) \in \mathbb{Z}^{k}$, let

$$
t^{\mathbf{p}} \equiv t_{1}^{p_{1}} t_{2}^{p_{2}} \ldots t_{k}^{p_{k}}
$$

Lemma 2.4. Let $(M, \tau)$ be a toric pair.
(a) The subset $P_{M}^{\tau} \subset\left(\mathbb{R}^{\geqslant 0}\right)^{N}$ is a polytope (i.e. the convex hull of a finite set of points).
(b) Let $\eta \in \mathbb{R}^{k}$ be any regular value of $\mu_{M}$. If $w \in P_{M}^{\eta}$, then

$$
M:\left\{v \in \mathbb{R}^{N}: \operatorname{supp}(v) \subseteq \operatorname{supp}(w)\right\} \longrightarrow \mathbb{R}^{k}
$$

is onto. In particular, if $w \in P_{M}^{\eta}$, then $|\operatorname{supp}(w)| \geqslant k$.
(c) If $J \in \mathscr{V}_{M}^{\tau}$, then $J=\operatorname{supp}(y)$ for some $y \in \mu_{M}^{-1}(\tau)$.
(d) If $J \subseteq[N]$ and $\operatorname{supp}(v) \subseteq J$ for some $v \in P_{M}^{\tau}$, then $\operatorname{supp}(w)=J$ for some $w \in P_{M}^{\tau}$.
(e) The polytope $P_{M}^{\tau}$ has dimension $N-k$.
(f) If $v$ is a vertex of $P_{M}^{\tau}$, then $\operatorname{supp}(v) \in \mathscr{V}_{M}^{\tau}$.
(g) If Vertices ${ }_{M}^{\tau}$ is the set of vertices of the polytope $P_{M}^{\tau}$, the map

$$
\operatorname{supp}: \operatorname{Vertices}_{M}^{\tau} \longrightarrow \mathscr{V}_{M}^{\tau}, \quad v \longrightarrow \operatorname{supp}(v),
$$

is a bijection.
(h) If $y \in \mu_{M}^{-1}(\tau)$, then $\operatorname{supp}(y) \supseteq J$ for some $J \in \mathscr{V}_{M}^{\tau}$.
(i) Let $z \in \mathbb{C}^{N}$. Then, $z \in \tilde{X}_{M}^{\tau}$ if and only if $\operatorname{supp}(z) \supseteq J$ for some $J \in \mathscr{V}_{M}^{\tau}$.
(j) Let $I, J \in \mathscr{V}_{M}^{\tau}$ and $t^{(n)} \in \mathbb{T}^{k}$. If $\left|t^{(n)}\right| \longrightarrow \infty$ and there exists $\delta>0$ such that $\left|t_{i}^{(n)}\right| \geqslant \delta$ for all $i \in[k]$, then $\left|\left(t^{(n)}\right)^{M_{I}^{-1} M_{j}}\right|$ is unbounded for some $j \in J$.
Proof. (a) By [Zi, Theorem 1.1], a subset of $\mathbb{R}^{N}$ is a polytope if and only if it is a bounded intersection of half-spaces. Thus, the claim follows from (iii) in Definition [2.1,
(b) This is immediate from the surjectivity of $\mathrm{d}_{w} \mu_{M}$.
(c) This follows from the second statement in (b).
(d) Assume that $\operatorname{supp}(v) \subseteq I \varsubsetneqq J$ and that there exists $v^{\prime} \in P_{M}^{\tau}$ with $\operatorname{supp}\left(v^{\prime}\right)=I$. Let $I_{1} \supset I$ with $I_{1} \subseteq J$ and $\left|I_{1}\right|=|I|+1$. We show that there exists $w \in P_{M}^{\tau}$ with $\operatorname{supp}(w)=I_{1}$. By the first statement in $(b)$, there exists $w^{\prime} \in M^{-1}(\tau) \subset \mathbb{R}^{N}$ with $\operatorname{supp}\left(w^{\prime}\right)=I_{1}$. Let $w=(1-\lambda) v^{\prime}+\lambda w^{\prime}$ with $\lambda \in \mathbb{R}$ satisfying

$$
\lambda w_{j}^{\prime}>0 \quad \text { if } \quad j \in I_{1}-I \quad \text { and } \quad \lambda\left(1-\frac{w_{j}^{\prime}}{v_{j}^{\prime}}\right)<1 \quad \forall j \in I .
$$

(e) By (d) together with the second condition in (i) in Definition 2.1, $\operatorname{supp}(w)=[N]$ for some $w \in P_{M}^{\tau}$ and thus $\operatorname{dim} P_{M}^{\tau}=N-k$, since $M$ has rank $k$ by (b).
$(f) \operatorname{By}(e),|\operatorname{supp}(v)| \leqslant k$; the opposite inequality follows from the second statement in (b).
$(g) \operatorname{By}(f), \operatorname{supp}(v) \in \mathscr{V}_{M}^{\tau}$ for every vertex $v$ of $P_{M}^{\tau}$. The map supp is injective by (ii)] in Definition 2.1 and surjective by (c) and (ii) in Definition 2.1.
(h) By [Zi, Proposition 2.2], every polytope is the convex hull of its vertices; since $\mu_{\text {std }}(y) \in P_{M}^{\tau}$ and $P_{M}^{\tau}$ is a polytope by (a),

$$
\mu_{\mathrm{std}}(y)=\sum_{s=1}^{r} \lambda_{s} v_{s}
$$

for some vertices $v_{1}, v_{2}, \ldots, v_{r} \in P_{M}^{\tau}$ and $\lambda_{1}, \lambda_{2}, \ldots, \lambda_{r} \in \mathbb{R}^{>0}$. Then, $\operatorname{supp}(y) \supseteq \operatorname{supp}\left(v_{1}\right)$ and $\operatorname{supp}\left(v_{1}\right) \in \mathscr{V}_{M}^{\tau}$ by $(f)$.
(i) If $z \in \widetilde{X}_{M}^{\tau}$, there exists $y \in \mathbb{C}^{\operatorname{supp}(z)} \cap \mu_{M}^{-1}(\tau)$. By (h), there exists $J \in \mathscr{V}_{M}^{\tau}$ with $J \subseteq \operatorname{supp}(y)$. Since $\operatorname{supp}(y) \subseteq \operatorname{supp}(z)$, it follows that $J \subseteq \operatorname{supp}(z)$. The converse follows from (c).
(j) By (c), there exist $v, w \in\left(\mathbb{R}^{>0}\right)^{k}$ such that $M_{I} v=\tau=M_{J} w$. By (ii) in Definition [2.1, it follows that there exists $\mathfrak{a} \in\left(\mathbb{Z}^{>0}\right)^{k}$ such that $M_{I}^{-1} M_{J} \mathfrak{a} \in\left(\mathbb{Z}^{>0}\right)^{k}$.

Assume by contradiction that $\left|\left(t^{(n)}\right)^{M_{I}^{-1} M_{j}}\right|$ is a bounded sequence for all $j \in J$. By passing to subsequences, we may assume that $\left|\left(t^{(n)}\right)^{M_{I}^{-1} M_{j}}\right|$ is convergent for all $j \in J$. It follows that

$$
\begin{equation*}
\prod_{j \in J}\left|\left(t^{(n)}\right)^{M_{I}^{-1} M_{j}}\right|^{\mathfrak{a}_{j}}=\left|\left(t^{(n)}\right)^{M_{I}^{-1} M_{J} \mathfrak{a}}\right| \tag{2.5}
\end{equation*}
$$

is also convergent. On the other hand, by passing to some subsequences, we may assume that for each $i \in[k],\left|t_{i}^{(n)}\right|$ has a limit (possibly $\infty$ ). Since at least one of these limits is $\infty$ and none is 0 , the right-hand side of (2.5) diverges leading to a contradiction.

For $z \in \mathbb{C}^{N}$ and $J=\left\{j_{1}<j_{2}<\ldots<j_{n}\right\} \subseteq[N]$, let

$$
z_{J} \equiv\left(z_{j_{1}}, z_{j_{2}}, \ldots, z_{j_{n}}\right)
$$

For $z \in \widetilde{X}_{M}^{\tau}$, let $[z] \in X_{M}^{\tau}$ denote the corresponding class.
Lemma 2.5. Let $(M, \tau)$ be a toric pair.
(a) The space $\widetilde{X}_{M}^{\tau}$ is path-connected.
(b) The torus $\mathbb{T}^{k}$ acts freely on $\tilde{X}_{M}^{\tau}$.
(c) The subset $\mathbb{T}^{k} \cdot \mu_{M}^{-1}(\tau)$ of $\mathbb{C}^{N}$ is open.
(d) The subset $\mathbb{T}^{k} \cdot \mu_{M}^{-1}(\tau)$ of $\tilde{X}_{M}^{\tau}$ is closed.
(e) There is a unique map

$$
\rho_{M}^{\tau}: \tilde{X}_{M}^{\tau} \longrightarrow\left(\mathbb{R}^{>0}\right)^{k} \subset \mathbb{T}^{k} \quad \text { s.t. } \quad \rho_{M}^{\tau}(z) \cdot z \in \mu_{M}^{-1}(\tau) \quad \forall z \in \widetilde{X}_{M}^{\tau}
$$

Furthermore, this map is smooth.
(f) The quotient $\mu_{M}^{-1}(\tau) /\left(S^{1}\right)^{k}$ is a compact and Hausdorff.
(g) The inclusion $\mu_{M}^{-1}(\tau) \hookrightarrow \widetilde{X}_{M}^{\tau}$ induces a homeomorphism

$$
\begin{equation*}
\mu_{M}^{-1}(\tau) /\left(S^{1}\right)^{k} \longrightarrow X_{M}^{\tau} \tag{2.6}
\end{equation*}
$$

In particular, $X_{M}^{\tau}$ is compact and Hausdorff.
(h) The space $X_{M}^{\tau}$ is a complex manifold of complex dimension $N-k$.

Proof. (a) This holds since $\widetilde{X}_{M}^{\tau}$ is the complement of coordinate subspaces in $\mathbb{C}^{N}$. (b) Let $t \in \mathbb{T}^{k}$ and $z \in \tilde{X}_{M}^{\tau}$ be such that $t \cdot z=z$. By Lemma 2.4) (i), there exists $J \in \mathscr{V}_{M}^{\tau}$ such that

$$
J \equiv\left\{j_{1}<\ldots<j_{k}\right\} \subseteq \operatorname{supp}(z)
$$

By (ii) in Definition 2.1, the group homomorphism

$$
\mathbb{T}^{k} \longrightarrow \mathbb{T}^{k}, \quad t \longrightarrow\left(t^{M_{j_{1}}}, \ldots, t^{M_{j_{k}}}\right)
$$

is injective and so $t=(1,1, \ldots, 1)$.
(c) For each $z \in \mathbb{C}^{N}$, let

$$
M_{z} \equiv M\left(\begin{array}{ccc}
\left|z_{1}\right| & & 0 \\
& \ddots & \\
0 & & \left|z_{N}\right|
\end{array}\right)
$$

If $z \in \mu_{M}^{-1}(\tau), \operatorname{supp}(z) \supseteq J$ for some $J \in \mathscr{V}_{M}^{\tau}$ by Lemma 2.4] $(h)$. Since $M_{J}$ is invertible by (ii) in Definition [2.1, so are $\left(M_{z}\right)_{J}$ and $M_{z}\left(M_{z}\right)^{\text {tr }}$. Since the differential of the map

$$
\left(\mathbb{R}^{>0}\right)^{k} \longrightarrow \mathbb{R}^{k}, \quad t \longrightarrow \mu_{M}(t \cdot z)
$$

at $t=(1, \ldots, 1) \in\left(\mathbb{R}^{>0}\right)^{k} \subset \mathbb{T}^{k}$ is $2 M_{z}\left(M_{z}\right)^{\text {tr }}$, the differential of the map

$$
\mathbb{T}^{k} \times \mu_{M}^{-1}(\tau) \longrightarrow \mathbb{R}^{k}, \quad(t, z) \longrightarrow \mu_{M}(t \cdot z)
$$

is surjective at $(1, z)$ for all $z \in \mu_{M}^{-1}(\tau)$. Since the restriction of this differential to the second component vanishes, the differential of the map

$$
\begin{equation*}
\mathbb{T}^{k} \times \mu_{M}^{-1}(\tau) \longrightarrow \mathbb{C}^{N}, \quad(t, z) \longrightarrow t \cdot z \tag{2.7}
\end{equation*}
$$

is surjective at $(1, z)$ for all $z \in \mu_{M}^{-1}(\tau)$ and so, by the Inverse Function Theorem, the image of (2.7) contains an open neighborhood of $\mu_{M}^{-1}(\tau)$ in $\mathbb{C}^{N}$.
(d) Let $z^{(n)} \in \widetilde{X}_{M}^{\tau}$ and $t^{(n)} \in \mathbb{T}^{k}$ be sequences such that

$$
\lim _{n \longrightarrow \infty} z^{(n)}=z \in \widetilde{X}_{M}^{\tau} \quad \text { and } \quad y^{(n)} \equiv t^{(n)} \cdot z^{(n)} \in \mu_{M}^{-1}(\tau)
$$

By (iii) in Definition [2.1, we can assume that $y^{(n)} \longrightarrow y \in \mu_{M}^{-1}(\tau)$. By Lemma 2.4(i), there exist $J(y), J(z) \in \mathscr{V}_{M}^{\tau}$ such that

$$
J(y) \equiv\left\{j_{1}<\ldots<j_{k}\right\} \subseteq \operatorname{supp}(y) \quad \text { and } \quad J(z) \subseteq \operatorname{supp}(z) ;
$$

we can assume that $J(y), J(z) \subseteq \operatorname{supp}\left(y^{(n)}\right)=\operatorname{supp}\left(z^{(n)}\right)$ for all $n$. By (ii) in Definition 2.1, $M_{J(y)}$ is invertible and so

$$
t_{i}^{(n)}=\left(\tilde{t}^{(n)}\right)^{\left(M_{J(y)}^{-1}\right)_{i}}, \quad \text { where } \quad\left(\tilde{t}^{(n)}\right)_{i}=\frac{\left(y^{(n)}\right)_{j_{i}}}{\left(z^{(n)}\right)_{j_{i}}} \quad \forall i=1, \ldots, k
$$

Since $\left(y^{(n)}\right)_{j} \longrightarrow y_{j} \neq 0$ for all $j \in J(y)$ and $\left(z^{(n)}\right)_{j} \longrightarrow z_{j},\left|(\tilde{t}(n))_{i}\right| \geqslant \delta$ for some $\delta \in \mathbb{R}^{>0}$ and for all $n$ and $i$. If $|(\tilde{t}(n))|$ is not bounded above, after passing to a subsequence we can
assume that $\left|\tilde{t}^{(n)}\right| \longrightarrow \infty$. By Lemma $2.4(j)$, there exists $j \in J(z)$ such that, after passing to a subsequence,

$$
\left|\left(t^{(n)}\right)^{M_{j}}\right|=\left|\left(\tilde{t}^{(n)}\right)^{M_{J(y)}^{-1}}{ }^{M_{j}}\right| \longrightarrow \infty .
$$

Since $t^{(n)} \cdot z^{(n)} \longrightarrow y$, it follows that $\left(z^{(n)}\right)_{j} \longrightarrow 0$ and so $j \notin \operatorname{supp}(z)$, contrary to the assumption. Thus, $\left\{\tilde{t}{ }^{(n)}\right\}$ is a compact subset of $\mathbb{T}^{k}$. After passing to a subsequence, we can thus assume that $t^{(n)} \longrightarrow t \in \mathbb{T}^{k}$. It follows that

$$
t \cdot z=\lim _{n \longrightarrow \infty} t^{(n)} \cdot \lim _{n \longrightarrow \infty} z^{(n)}=\lim _{n \longrightarrow \infty} t^{(n)} \cdot z^{(n)}=\lim _{n \longrightarrow \infty} y^{(n)}=y .
$$

Thus, $z \in \mathbb{T}^{k} \cdot \mu_{M}^{-1}(\tau)$.
(e) By the proof of (c), $\tau$ is a regular value of the smooth map

$$
\Phi:\left(\mathbb{R}^{>0}\right)^{k} \times \tilde{X}_{M}^{\tau} \longrightarrow \mathbb{R}^{k}, \quad(t, z) \longrightarrow \mu_{M}(t \cdot z)
$$

and the projection map $\pi_{2}: \Phi^{-1}(\tau) \longrightarrow \widetilde{X}_{M}^{\tau}$ is a submersion. By (a), (c), and (d), this map is surjective. We show that it is also injective; by $(a),(c)$, and $(d)$, this is equivalent to showing that

$$
\left(r_{1}, \ldots, r_{k}\right) \in \mathbb{R}^{k}, z,\left(\mathrm{e}^{r_{1}}, \ldots, \mathrm{e}^{r_{k}}\right) \cdot z \in \mu_{M}^{-1}(\tau) \quad \Longrightarrow \quad r_{i}=0 \quad \forall i=1, \ldots, k,
$$

where the action of $\left(\mathrm{e}^{r_{1}}, \ldots, \mathrm{e}^{r_{k}}\right) \in \mathbb{T}^{k}$ on $z$ is defined by (2.1) as above. We present the argument in the proof of [Ki, 7.2 Lemma]. Let

$$
f: \mathbb{R} \longrightarrow \mathbb{R}, \quad f(u) \equiv\left\langle\mu_{M}\left[\left(\mathrm{e}^{u r_{1}}, \ldots, \mathrm{e}^{u r_{k}}\right) \cdot z\right],\left(r_{1}, \ldots, r_{k}\right)\right\rangle \quad \forall u \in \mathbb{R}
$$

Since $f(0)=f(1)$, there exists $u_{0} \in(0,1)$ such that $f^{\prime}\left(u_{0}\right)=0$. Since

$$
f^{\prime}\left(u_{0}\right)=2 \sum_{j=1}^{N} \mathrm{e}^{2 u_{0}\left\langle\left(r_{1}, \ldots, r_{k}\right), M_{j}\right\rangle}\left\langle\left(r_{1}, \ldots, r_{k}\right), M_{j}\right\rangle^{2}\left|z_{j}\right|^{2},
$$

$f^{\prime}\left(u_{0}\right)=0$ implies that $\left\langle\left(r_{1}, \ldots, r_{k}\right), M_{j}\right\rangle z_{j}=0$ for all $j \in[N]$. By Lemma 2.4] $(i)$, there exists $J \in \mathscr{V}_{M}^{\tau}$ such that $J \subseteq \operatorname{supp}(z)$ and so $\left\langle\left(r_{1}, \ldots, r_{k}\right), M_{j}\right\rangle=0$ for all $j \in J$. By (ii) in Definition [2.1] this implies that $r_{i}=0$ for all $i \in[k]$. The map $\rho_{M}^{\tau}$ is $\pi_{2}^{-1}$ composed with the projection $\left(\mathbb{R}^{>0}\right)^{k} \times X_{M}^{\tau} \longrightarrow\left(\mathbb{R}^{>0}\right)^{k}$.
(f) Since $\mu_{M}^{-1}(\tau)$ is compact by (iii) in Definition 2.1, so is the quotient space $\mu_{M}^{-1}(\tau) /\left(S^{1}\right)^{k}$. If $p$ is the quotient projection map and $A \subset \mu_{M}^{-1}(\tau)$ is a closed subset,

$$
p^{-1}(p(A))=\left(S^{1}\right)^{k} \cdot A \equiv\left\{t \cdot z: z \in A, t \in\left(S^{1}\right)^{k}\right\}
$$

is the image of the compact subset $\left(S^{1}\right)^{k} \times A$ in $\mu_{M}^{-1}(\tau)$ under the continuous multiplication map

$$
\left(S^{1}\right)^{k} \times \mu_{M}^{-1}(\tau) \longrightarrow \mu_{M}^{-1}(\tau)
$$

and thus compact. Since $\mu_{M}^{-1}(\tau)$ is Hausdorff, it follows that $p^{-1}(p(A))$ is a closed subset of $\mu_{M}^{-1}(\tau)$. We conclude the quotient map $p$ is a closed map. Since $\mu_{M}^{-1}(\tau)$ is a normal topological space, by Mu , Lemma 73.3] so is $\mu_{M}^{-1}(\tau) /\left(S^{1}\right)^{k}$.
(g) The map (2.6) is well-defined, since the inclusion $\mu_{M}^{-1}(\tau) \hookrightarrow \widetilde{X}_{M}^{\tau}$ is equivariant under the inclusion $\left(S^{1}\right)^{k} \hookrightarrow \mathbb{T}^{k}$, and is continuous by the defining property of the quotient topology. The map

$$
\tilde{X}_{M}^{\tau} \longrightarrow \mu_{M}^{-1}(\tau), \quad z \longrightarrow \rho_{M}^{\tau}(z) \cdot z
$$

is equivariant with respect to the natural projection $\mathbb{T}^{k} \longrightarrow\left(S^{1}\right)^{k}$ by the uniqueness property in (e) and thus induces a continuous map in the opposite direction to (2.6). Since $\left.\rho_{M}^{\tau}\right|_{\left(\mu_{M}^{-1}(\tau)\right)}=$ $(1, \ldots, 1)$, the two maps are easily seen to be mutual inverses.
(h) We cover $X_{M}^{\tau}$ by holomorphic charts as in Ba, Propositions 2.17, 2.18]. For each $J \in \mathscr{V}_{M}^{\tau}$, let

$$
\begin{gather*}
{[N]-J \equiv\left\{i_{1}<i_{2}<\ldots<i_{N-k}\right\}, \quad \widetilde{U}_{J} \equiv\left\{z \in \mathbb{C}^{N}: \operatorname{supp}(z) \supseteq J\right\}, \quad U_{J} \equiv \widetilde{U}_{J} / \mathbb{T}^{k}} \\
h_{J}: U_{J} \longrightarrow \mathbb{C}^{N-k}, \quad h_{J}[z] \equiv\left(\frac{z_{i_{1}}}{z_{J}^{M_{J}^{-1} M_{i_{1}}}}, \frac{z_{i_{2}}}{z_{J}^{M_{J}^{-1} M_{i_{2}}}}, \ldots, \frac{z_{i_{N-k}}}{\left.z_{J}^{M_{J}^{-1 M_{i_{N-k}}}}\right)}\right. \text { ) } \tag{2.8}
\end{gather*}
$$

By Lemma 2.4](i), the collections $\left\{\widetilde{U}_{J}: J \in \mathscr{V}_{M}^{\tau}\right\}$ and $\left\{U_{J}: J \in \mathscr{V}_{M}^{\tau}\right\}$ cover $\widetilde{X}_{M}^{\tau}$ and $X_{M}^{\tau}$, respectively. The map $h_{J}$ is well-defined. First, $M_{J}^{-1}$ exists and is an integer matrix by (ii) in Definition [2.1. Second, if $t \in \mathbb{T}^{k}, z \in \widetilde{U}_{J}$, and $J \equiv\left\{j_{1}<j_{2}<\ldots<j_{k}\right\}$, then

$$
\begin{aligned}
(t \cdot z)_{J}^{-M_{J}^{-1} M_{i_{s}}}(t \cdot z)_{i_{s}} & =\left(\left(t^{M_{j_{1}}} z_{j_{1}}\right)^{-\left(M_{J}^{-1} M_{i_{s}}\right)_{1}} \ldots\left(t^{M_{j_{k}}} z_{j_{k}}\right)^{-\left(M_{J}^{-1} M_{i_{s}}\right)_{k}}\right) t^{M_{i_{s}}} z_{i_{s}} \\
& =t^{-M_{J}\left(M_{J}^{-1} M_{i_{s}}\right)+M_{i_{s}}} z_{J}^{-M_{J}^{-1} M_{i_{s}}} z_{i_{s}}=z_{J}^{-M_{J}^{-1} M_{i_{s}}} z_{i_{s}}, \quad \forall s \in[N-k] .
\end{aligned}
$$

The map $h_{J}^{-1}$ is the composition of the continuous maps

$$
\mathbb{C}^{N-k} \xrightarrow{\widetilde{h_{J}^{-1}}} \widetilde{U}_{J} \xrightarrow{\text { projection }} U_{J}, \quad\left(\widetilde{h_{J}^{-1}}(z)\right)_{i}=\left\{\begin{array}{ll}
z_{s}, & \text { if } i=i_{s}, \\
1, & \text { if } i \in J,
\end{array} \quad \forall i \in[N] .\right.
$$

The composition $\mathbb{C}^{N-k} \longrightarrow U_{J} \xrightarrow{h_{J}} \mathbb{C}^{N-k}$ is obviously the identity. The other relevant composition is given by $U_{J} \ni[z] \longrightarrow[y] \in U_{J}$, where

$$
y_{i}=\left\{\begin{array}{ll}
z_{J}^{-M_{J}^{-1} M_{i_{s}}} \cdot z_{i_{s}}, & \text { if } i=i_{s}, \\
1, & \text { if } i \in J,
\end{array} \quad \forall j \in[N]\right.
$$

Let $t_{r} \equiv z_{J}^{-\left(M_{J}^{-1}\right)_{r}}$ for all $r \in[k]$; it follows that $t \cdot z=y$.
If in addition $J^{\prime} \in \mathscr{V}_{M}^{\tau}$, the domain and image of the overlap map $h_{J} \circ h_{J^{\prime}}^{-1}$ are complements of some the coordinate subspaces in $\mathbb{C}^{N-k}$, and every component of this map is a ratio of monomials in the complex coordinates. In particular, this map is holomorphic.
Remark 2.6. Let $(M, \tau)$ be a toric pair. The projection $\pi: \tilde{X}_{M}^{\tau} \longrightarrow X_{M}^{\tau}$ is a holomorphic submersion; this can be seen using the charts (2.8).

Let $K_{M}^{\tau}$ be the connected component of $\tau$ inside the regular value locus of $\mu_{M}$.
Lemma 2.7. Let $(M, \tau)$ be a toric pair.
(a) Let $\eta \in \mathbb{R}^{k}$. Then, $\eta$ is a regular value of $\mu_{M}$ if and only if $\eta \notin M_{J}\left(\mathbb{R}^{\geqslant 0}\right)^{|J|}$ for every $J \subset[N]$ with $|J| \leqslant k-1$.
(b) The subset $K_{M}^{\tau}$ of $\mathbb{R}^{k}$ is an open cone (i.e. an open subset of $\mathbb{R}^{k}$ such that $\lambda \eta \in K_{M}^{\tau}$ whenever $\lambda>0$ and $\eta \in K_{M}^{\tau}$ ).
(c) For every $\eta \in K_{M}^{\tau}, \mathscr{V}_{M}^{\eta}=\mathscr{V}_{M}^{\tau}$.
(d) For every $\eta \in K_{M}^{\tau},(M, \eta)$ is a toric pair and $X_{M}^{\eta}=X_{M}^{\tau}$.

Proof. (a) If $\eta$ is a regular value of $\mu_{M}, \eta \notin M_{J}\left(\mathbb{R}^{\geqslant 0}\right)^{|J|}$ for every $J \subset[N]$ with $|J| \leqslant k-1$ by the second statement in Lemma 2.4](b), Suppose $\eta \notin M_{J}\left(\mathbb{R}^{\geqslant 0}\right)^{|J|}$ for every $J \subset[N]$ with $|J| \leqslant k-1$. We prove that for every $v \in P_{M}^{\eta}$ there exists $J \subseteq \operatorname{supp}(v)$ such that $|J|=k$ and $\operatorname{det} M_{J} \neq 0$. Suppose not, i.e. $\operatorname{det} M_{J}=0$ for all $J \subseteq \operatorname{supp}(v)$ with $|J|=k$. We show that there exists $v^{\prime} \in P_{M}^{\eta}$ with $\left|\operatorname{supp}\left(v^{\prime}\right)\right|<k$; this contradicts the assumption on $\eta$. If $|\operatorname{supp}(v)| \geqslant k$, there exists $w \in M^{-1}(0) \subset \mathbb{R}^{N}$ such that $\operatorname{supp}(w) \subseteq \operatorname{supp}(v)$ and $w_{j_{0}}>0$ for some $j_{0} \in \operatorname{supp}(v)$. Let

$$
\lambda \equiv \min \left\{\frac{v_{j}}{w_{j}}: j \in \operatorname{supp}(v) \text { such that } w_{j}>0\right\} .
$$

It follows that $v-\lambda w \in P_{M}^{\eta}$ and $\operatorname{supp}(v-\lambda w) \varsubsetneqq \operatorname{supp}(v)$. Continuing in this way, we obtain $v^{\prime} \in P_{M}^{\eta}$ with $\left|\operatorname{supp}\left(v^{\prime}\right)\right|<k$.
(b) This follows immediately from (a).
(c) We show that the set $\left\{\eta \in K_{M}^{\tau}: \mathscr{V}_{M}^{\eta}=\mathscr{V}_{M}^{\tau}\right\}$ is open and closed in $K_{M}^{\tau}$ and thus equals $K_{M}^{\tau}$. It suffices to show that for any $\mathscr{P} \subseteq\{J \subseteq[N]:|J|=k\}$ the set

$$
\left\{\eta \in K_{M}^{\tau}: \mathscr{V}_{M}^{\eta}=\mathscr{P}\right\}=\bigcap_{J \in \mathscr{P}}\left\{\eta \in K_{M}^{\tau}: P_{M}^{\eta} \cap \mathbb{R}^{J} \neq \varnothing\right\} \cap \bigcap_{\substack{J \subseteq[N]| | J \mid=k \\ J \notin \mathscr{P}}}\left\{\eta \in K_{M}^{\tau}: P_{M}^{\eta} \cap \mathbb{R}^{J}=\varnothing\right\}
$$

is open. We show that the set

$$
\left\{\eta \in K_{M}^{\tau}: P_{M}^{\eta} \cap \mathbb{R}^{J} \neq \varnothing\right\}
$$

with $J \subseteq[N]$ and $|J|=k$ is open. Let $\eta^{\prime}$ be any of its elements and let $w \in P_{M}^{\eta^{\prime}} \cap \mathbb{R}^{J}$. By the surjectivity of $\mathrm{d}_{w} \mu_{M}, \operatorname{supp}(w)=J$ and $\operatorname{det} M_{J} \neq 0$; this shows that $M_{J}\left(\mathbb{R}^{>0}\right)^{k}$ is open and

$$
\eta^{\prime} \in M_{J}\left(\mathbb{R}^{>0}\right)^{k} \cap K_{M}^{\tau} \subseteq\left\{\eta \in K_{M}^{\tau}: P_{M}^{\eta} \cap \mathbb{R}^{J} \neq \varnothing\right\}
$$

The set

$$
\left\{\eta \in K_{M}^{\tau}: P_{M}^{\eta} \cap \mathbb{R}^{J}=\varnothing\right\}=K_{M}^{\tau}-M_{J}\left(\mathbb{R}^{\geqslant 0}\right)^{|J|}
$$

with $J \subseteq[N]$ and $|J|=k$ is open as well.
(d) Since $P_{M}^{\tau} \neq \varnothing, \mu_{M}^{-1}(\tau) \neq \varnothing$ and so $\mathscr{V}_{M}^{\tau} \neq \varnothing$ by Lemma 2.4)(h). Since $\mathscr{V}_{M}^{\tau} \neq \varnothing, \mathscr{V}_{M}^{\eta} \neq \varnothing$ by $(c)$ and so $P_{M}^{\eta} \neq \varnothing$. Since $(M, \tau)$ satisfies (ii) in Definition 2.1, by ( $(c)$ so does $(M, \eta)$. Thus, $(M, \eta)$ is toric. The equality $X_{M}^{\eta}=X_{M}^{\tau}$ follows from (c) together with Lemma 2.4) (i).

Lemma 2.8. Let $(M, \tau)$ be a toric pair.
(a) The quotient $\mu_{M}^{-1}(\tau) /\left(S^{1}\right)^{k}$ admits a unique smooth structure such that the projection

$$
\begin{equation*}
\pi_{\tau}: \mu_{M}^{-1}(\tau) \longrightarrow \mu_{M}^{-1}(\tau) /\left(S^{1}\right)^{k} \tag{2.9}
\end{equation*}
$$

is a submersion.
(b) There exists a unique symplectic form $\omega_{\tau}$ on $\mu_{M}^{-1}(\tau) /\left(S^{1}\right)^{k}$ such that

$$
\pi_{\tau}^{*} \omega_{\tau}=\left.\omega_{\operatorname{std}}\right|_{\mu_{M}^{-1}(\tau)},
$$

where $\pi_{\tau}$ is the projection (2.9).
(c) The map (2.6) is a diffeomorphism.

Proof. (a) By tD, Proposition 5.2], if $G$ is a compact Lie group acting freely and smoothly on a manifold $M$, then the quotient $M / G$ carries a unique differentiable structure such that the projection

$$
M \longrightarrow M / G
$$

is a submersion. Thus, the claim follows from (i) in Definition 2.1 and Lemma 2.5) b),
(b) This follows from the Marsden-Weinstein symplectic reduction theorem MW, Theorem 1].
(c) By (a) and Lemma 2.5(g), it is enough to show that the restriction

$$
\left.\pi\right|_{\mu_{M}^{-1}(\tau)}: \mu_{M}^{-1}(\tau) \longrightarrow X_{M}^{\tau}
$$

of the projection $\pi: \tilde{X}_{M}^{\tau} \longrightarrow X_{M}^{\tau}$ is a submersion. This follows from the fact that the map

$$
\mathbb{T}^{k} \times \mu_{M}^{-1}(\tau) \longrightarrow X_{M}^{\tau}, \quad(t, z) \longrightarrow[z],
$$

is a submersion whose differential at $(t, z)$ vanishes on $T_{t} \mathbb{T}^{k} \times 0$. This map is a submersion because it is the composition of two submersions,

$$
\mathbb{T}^{k} \times \mu_{M}^{-1}(\tau) \longrightarrow \tilde{X}_{M}^{\tau}, \quad(t, z) \longrightarrow t \cdot z \quad \text { and } \quad \pi: \tilde{X}_{M}^{\tau} \longrightarrow X_{M}^{\tau}
$$

The former map is a submersion by the proof of Lemma 2.5) $(c)$, while $\pi$ is a submersion by Remark 2.6.

If $(M, \tau)$ is a toric pair, we abuse notation and denote by $\omega_{\tau}$ not only the form on $\mu_{M}^{-1}(\tau) /\left(S^{1}\right)^{k}$ defined by Lemma 2.8) (b), but also the form it induces on $X_{M}^{\tau}$ via the diffeomorphism (2.6) of Lemma 2.8(c). In this case, by Lemma 2.7) $(d)$ and Lemma 2.8(b), for every $\eta \in K_{M}^{\tau}, \omega_{\eta}$ is the unique symplectic form on $X_{M}^{\tau}$ satisfying

$$
\begin{equation*}
\left.\pi^{*} \omega_{\eta}\right|_{\mu_{M}^{-1}(\eta)}=\left.\omega_{\mathrm{std}}\right|_{\mu_{M}^{-1}(\eta)}, \quad \text { where } \quad \pi: \widetilde{X}_{M}^{\tau} \longrightarrow X_{M}^{\tau} \tag{2.10}
\end{equation*}
$$

is the projection; see also diagram (2.3).
Lemma 2.9. Let $(M, \tau)$ be a toric pair. For every $\eta \in K_{M}^{\tau}, \omega_{\eta}$ is Kähler with respect to the complex structure on $X_{M}^{\tau}$.

Proof. The form $\omega_{\eta}$ is positive with respect to the complex structure on $X_{M}^{\tau}$ by (2.10) together with the equality $\mathbb{T}^{k} \cdot \mu_{M}^{-1}(\eta)=\widetilde{X}_{M}^{\tau}$ (justified by Lemmas 2.5 $(g)$ and 2.7 (d)), Remark [2.6, and the positivity of $\omega_{\text {std }}$.

Remark 2.10. If $(M, \tau)$ is a toric pair and $J \subseteq[N]$, the pair $\left(M_{J}, \tau\right)$ is toric if and only if $P_{M_{J}}^{\tau} \neq \varnothing$. In this case, $X_{M_{J}}^{\tau}$ is a connected compact projective manifold of complex dimension $|J|-k$ by Proposition 2.2, It is biholomorphic to

$$
X_{M}^{\tau}(J) \equiv\left\{[z] \in X_{M}^{\tau}: \operatorname{supp}(z) \subseteq J\right\}
$$

via the map

$$
X_{M_{J}}^{\tau} \ni[z] \longrightarrow\left[\iota_{J}(z)\right] \in X_{M}^{\tau}(J), \quad \text { where } \quad\left(\iota_{J}(z)\right)_{j} \equiv \begin{cases}z_{r}, & \text { if } j=j_{r},  \tag{2.11}\\ 0, & \text { if } j \neq J,\end{cases}
$$

if $J=\left\{j_{1}<j_{2}<\ldots<j_{r}\right\}$. In particular, if $(M, \tau)$ is a minimal toric pair and $M_{\hat{j}}$ is the matrix obtained from $M$ by deleting the $j$-th column, then $X_{M_{\hat{j}}}^{\tau}$ is a connected compact projective manifold of complex dimension $N-1$. The map (2.11) identifies $X_{M_{\hat{j}}}^{\tau}$ with the hypersurface

$$
\begin{equation*}
X_{M}^{\tau}([N]-\{j\}) \equiv D_{j} \equiv\left\{[z] \in X_{M}^{\tau}: z_{j}=0\right\} \tag{2.12}
\end{equation*}
$$

If $J \in \mathscr{V}_{M}^{\tau}$ with $\mathscr{V}_{M}^{\tau}$ defined by (2.4), then $X_{M}^{\tau}(J)$ is the point

$$
[J] \equiv\left[z_{1}, \ldots, z_{N}\right], \quad \text { where } \quad z_{j} \equiv \begin{cases}1, & \text { if } j \in J  \tag{2.13}\\ 0, & \text { otherwise }\end{cases}
$$

This follows from Lemma 2.4 (i) and (ii) in Definition 2.1.
If $J \subseteq[N]$ is such that $P_{M}^{\tau} \cap \mathbb{R}^{J} \neq \varnothing$ and $|J|=k+1$, then $X_{M}^{\tau}(J)$ is a one-dimensional complex manifold and there exist exactly 2 multi-indices $I \in \mathscr{V}_{M}^{\tau}$ with $I \subset J$. The latter follows since multi-indices $I \in \mathscr{V}_{M}^{\tau}$ with $I \subset J$ correspond bijectively via $\iota_{J}$ to elements of $\mathscr{V}_{M_{J}}^{\tau}$, which in turn correspond to the vertices of $P_{M_{J}}^{\tau}$ by Lemma 2.4(g)] $P_{M_{J}}^{\tau}$ has dimension 1 by Lemma 2.4(e).

Remark 2.11. If $(M, \tau)$ is a toric pair with $M$ a $k \times N$ matrix, then $(V M, V \tau)$ is a toric pair whenever $V \in \mathrm{GL}_{k}(\mathbb{Z})$. In this case, $\mathscr{V}_{M}^{\tau}=\mathscr{V}_{V M}^{V \tau}$ and $X_{M}^{\tau}$ is biholomorphic to $X_{V M}^{V \tau}$. The pair $(V M, V \tau)$ satisfies the first condition of (i) in Definition 2.1, since $V$ is an isomorphism. Since $P_{M}^{\tau}=P_{V M}^{V \tau}, \mathscr{V}_{M}^{\tau}=\mathscr{V}_{V M}^{V \tau}$ and so $(V M, V \tau)$ satisfies the second condition of (i), (ii), and (iii) in Definition 2.1 as well.

Remark 2.12. If $(M, \tau)$ is a toric pair with $M$ a $k \times(k+1)$ matrix, then $X_{M}^{\tau}$ is biholomorphic to $\mathbb{P}^{1}$. In order to see this, note first that $\left|\mathscr{V}_{M}^{\tau}\right|=2$ by Lemma 2.4] $(g)$ and Lemma 2.4) (e), By Remark 2.11, we can assume that $M_{J}=\operatorname{Id}_{k}$ for some $J \in \mathscr{V}_{M}^{\tau}$. The claim now follows from (2.8): $X_{M}^{\tau}$ is a compact manifold covered by two charts

$$
h_{J}: U_{J} \xrightarrow{\sim} \mathbb{C}, \quad h_{I}: U_{I} \xrightarrow{\sim} \mathbb{C}
$$

satisfying $h_{J}\left(U_{J} \cap U_{I}\right)=h_{I}\left(U_{J} \cap U_{I}\right)=\mathbb{C}^{*}$ since $I \cup J=[k+1]$ and $h_{I} \circ h_{J}^{-1}(z)=z^{ \pm 1}$ by (ii) in Definition 2.1.

### 2.2 Cohomology, Kähler cone, and Picard group

Throughout the remaining part of this dissertation, $(M, \tau)$ is a toric pair. In order to complete the proof in Section 2.1 that $X_{M}^{\tau}$ is projective, we describe some holomorphic line bundles over it. For each $\mathbf{p} \in \mathbb{Z}^{k}$, let

$$
\begin{equation*}
L_{\mathbf{p}} \equiv \tilde{X}_{M}^{\tau} \times \mathbf{p} \mathbb{C} \equiv \tilde{X}_{M}^{\tau} \times \mathbb{C} / \sim, \quad \text { where } \quad(z, c) \sim\left(t^{-1} \cdot z, t^{\mathbf{p}} c\right), \forall t \in \mathbb{T}^{k} \tag{2.14}
\end{equation*}
$$

Since $\pi: \widetilde{X}_{M}^{\tau} \longrightarrow X_{M}^{\tau}$ with $\pi(z) \equiv[z]$ is a $\mathbb{T}^{k}$-principal bundle by Lemma 2.5) $b$ and Remark 2.6.

$$
L_{\mathbf{p}} \longrightarrow X_{M}^{\tau}, \quad[z, c] \longrightarrow[z],
$$

is a holomorphic line bundle. Furthermore,

$$
L_{0}=\mathcal{O}_{X_{M}^{\tau}}, \quad L_{\mathbf{p}}^{*}=L_{-\mathbf{p}}, \quad L_{\mathbf{p}} \otimes L_{\mathbf{r}}=L_{\mathbf{p}+\mathbf{r}} .
$$

The line bundle $L_{-M_{j}}$ admits a holomorphic section

$$
\begin{equation*}
s_{j}: X_{M}^{\tau} \longrightarrow L_{-M_{j}}, \quad[z] \longrightarrow\left[z, z_{j}\right] . \tag{2.15}
\end{equation*}
$$

Since $s_{j}$ is transverse to the zero set by (2.8) and $s_{j}^{-1}(0)=D_{j}$ by (2.12), $c_{1}\left(L_{-M_{j}}\right)=\operatorname{PD}\left(D_{j}\right)$.
For all $j \in[N]$ and $i \in[k]$, let

$$
\begin{equation*}
\mathrm{U}_{j} \equiv c_{1}\left(L_{-M_{j}}\right), \quad \gamma_{i} \equiv L_{e_{i}}, \quad \mathrm{H}_{i} \equiv c_{1}\left(\gamma_{i}^{*}\right), \tag{2.16}
\end{equation*}
$$

where $\left\{e_{i}: i \in[k]\right\} \subset \mathbb{Z}^{k}$ is the standard basis. Thus,

$$
\begin{equation*}
L_{-M_{j}}=\gamma_{1}^{* \otimes m_{1 j}} \otimes \gamma_{2}^{* \otimes m_{2 j}} \otimes \ldots \otimes \gamma_{k}^{* \otimes m_{k j}} \quad \Longrightarrow \quad \mathrm{U}_{j}=\sum_{i=1}^{k} m_{i j} \mathrm{H}_{i} \quad \forall j \in[N] . \tag{2.17}
\end{equation*}
$$

Lemma 2.13 below is used in the proof of Proposition 2.2 in Section 2.1 and to describe the Kähler cone of $X_{M}^{\tau}$ in Proposition 2.16 below.

Lemma 2.13. For every $\eta \in \mathbb{Z}^{k} \cap K_{M}^{\tau}$,

$$
c_{1}\left(L_{-\eta}\right)=\frac{1}{\pi}\left[\omega_{\eta}\right],
$$

where $\omega_{\eta}$ is the Kähler form defined by (2.10).
Proof. We follow closely the proof of [Au, Proposition VII.3.1]. Let

$$
L_{-\eta}^{\mathbb{R}} \longrightarrow \mu_{M}^{-1}(\eta) /\left(S^{1}\right)^{k}
$$

be the pull-back of $L_{-\eta}$ via the diffeomorphism (2.6) of Lemma 2.8)(c) and

$$
L_{-\eta}^{S^{1}} \equiv \mu_{M}^{-1}(\eta) \times_{-\eta} S^{1} \xrightarrow{p} \frac{\mu_{M}^{-1}(\eta)}{\left(S^{1}\right)^{k}}
$$

be its sphere bundle. Let

be the natural projections.
Let $e_{i}^{\#}$ be the fundamental vector field on $\mu_{M}^{-1}(\eta) \times S^{1}$ corresponding to $e_{i} \in \mathbb{R}^{k}$ for the $\mathbb{T}^{k}$-action given by (2.14) with $\mathbf{p}=-\eta$. Thus,

$$
\begin{aligned}
e_{i}^{\#} & \left.\equiv \frac{\mathrm{~d}}{\mathrm{~d} t}\right|_{t=0}\left(\exp \left(\mathrm{i} t e_{i}\right) \cdot\left(x_{1}+\mathrm{i} y_{1}, \ldots, x_{N}+\mathrm{i} y_{N}, x+\mathrm{i} y\right)\right) \\
& =\sum_{j=1}^{N} m_{i j}\left(y_{j} \frac{\partial}{\partial x_{j}}-x_{j} \frac{\partial}{\partial y_{j}}\right)+\eta_{i}\left(y \frac{\partial}{\partial x}-x \frac{\partial}{\partial y}\right)
\end{aligned}
$$

where $x_{j}, y_{j}, x, y$ are the standard coordinates on $\mathbb{C}^{N} \equiv\left(\mathbb{R}^{2}\right)^{N}$ and $\mathbb{C} \equiv \mathbb{R}^{2}$, respectively. Let

$$
\alpha \equiv \sum_{j=1}^{N}\left(-x_{j} \mathrm{~d} y_{j}+y_{j} \mathrm{~d} x_{j}\right) \in \Omega^{1}\left(\mu_{M}^{-1}(\eta)\right) \quad \text { and } \quad \sigma \equiv x \mathrm{~d} y-y \mathrm{~d} x \in \Omega^{1}\left(S^{1}\right)
$$

Since $\iota_{e_{i}^{\#}}(\alpha \oplus \sigma)=0$ on $\mu_{M}^{-1}(\eta) \times S^{1}$ for all $i \in[k], \alpha \oplus \sigma$ descends to a 1-form $(\alpha \oplus \sigma)_{S^{1}}$ on $L_{-\eta}^{S^{1}}$. This form is a connection 1-form for the principal $S^{1}$-bundle $L_{-\eta}^{S^{1}}$ because it satisfies

$$
\mathcal{L}_{X^{\#}}(\alpha \oplus \sigma)_{S^{1}}=0, \quad \iota_{X \#}(\alpha \oplus \sigma)_{S^{1}}=1,
$$

where

$$
X^{\#}=-y \frac{\partial}{\partial x}+x \frac{\partial}{\partial y}
$$

is the fundamental vector field for the $S^{1}$-action on $L_{-\eta}^{S^{1}}$ as a principal $S^{1}$-bundle; see Au, Exercises V.4,V.5]. Let $\beta$ denote the curvature form associated to $(\alpha \oplus \sigma)_{S^{1}}$. By Au, Section V.4.c], it is uniquely determined by

$$
p^{*} \beta=\mathrm{d}(\alpha \oplus \sigma)_{S^{1}} .
$$

Since $q^{*} \mathrm{~d}\left((\alpha \oplus \sigma)_{S^{1}}\right)=-2 \widetilde{p}^{*} \omega_{\text {std }}, \beta=-2 \omega_{\eta}$ by the uniqueness of reduced symplectic form $\omega_{\eta}$ of Lemma 2.8](b). Thus, by [Au, Proposition VI.1.18] and [Au, Section VI.5.b],

$$
c_{1}\left(L_{-\eta}^{\mathbb{R}}\right)=\frac{-1}{2 \pi}[\beta]=\frac{1}{\pi}\left[\omega_{\eta}\right] \in H_{\mathrm{deR}}^{2}\left(\mu_{M}^{-1}(\eta) /\left(S^{1}\right)^{k}\right),
$$

as claimed.
We define

$$
\begin{equation*}
\mathcal{E}_{M}^{\tau} \equiv\left\{J \subseteq[N]: \bigcap_{j \in J} D_{j}=\varnothing\right\}=\left\{J \subseteq[N]: M_{J c}^{-1}(\tau) \cap\left(\mathbb{R}^{>0}\right)^{\left|J^{c}\right|}=\varnothing\right\} ; \tag{2.18}
\end{equation*}
$$

the second equality follows from Lemma [2.4) (i)\|(c)\|(d)] and (2.12)).

Proposition 2.14. If $(M, \tau)$ is a toric pair,

$$
H^{*}\left(X_{M}^{\tau}\right) \cong \frac{\mathbb{Q}\left[\mathrm{H}_{1}, \mathrm{H}_{2}, \ldots, \mathrm{H}_{k}, \mathrm{U}_{1}, \mathrm{U}_{2}, \ldots, \mathrm{U}_{N}\right]}{\left(\mathrm{U}_{j}-\sum_{i=1}^{k} m_{i j} \mathrm{H}_{i}, 1 \leqslant j \leqslant[N]\right)+\left(\prod_{j \in J} \mathrm{U}_{j}: J \in \mathcal{E}_{M}^{\tau}\right)}
$$

If, in addition $(M, \tau)$ is minimal, $H^{2}\left(X_{M}^{\tau} ; \mathbb{Z}\right)$ is free with basis $\left\{\mathrm{H}_{1}, \mathrm{H}_{2}, \ldots, \mathrm{H}_{k}\right\}$.
Proof. This follows from [McDSa, Section 11.3] together with Lemma 2.8](c).
Remark 2.15. By Proposition 2.14, $H^{*}\left(X_{M}^{\tau}\right)$ is generated as a $\mathbb{Q}$-algebra by $\left\{\mathrm{H}_{1}, \ldots, \mathrm{H}_{k}\right\}$. Along with (ii) in Definition [2.1, this implies that $H^{*}\left(X_{M}^{\tau}\right)$ is generated as a $\mathbb{Q}$-algebra by $\left\{\mathrm{U}_{1}, \ldots, \mathrm{U}_{N}\right\}$.

Proposition 2.16. If $(M, \tau)$ is a minimal toric pair, there is a basis $\left\{c_{1}\left(L_{-\eta_{i}}\right): i \in[k]\right\}$ for $H^{2}\left(X_{M}^{\tau}\right)$ formed by the first Chern classes of ample line bundles, with $L_{-\eta_{i}}$ as in (2.14). In particular, the Kähler cone $\mathcal{K}_{M}^{\tau}$ of $X_{M}^{\tau}$ has dimension $k$.

Proof. By Lemmas 2.13, 2.9, and 2.7)(b)|(d), there exists a subset $\left\{\eta_{1}, \ldots, \eta_{k}\right\} \subseteq \mathbb{Z}^{k}$, linearly independent over $\mathbb{Q}$, such that the line bundles $L_{-\eta_{j}}$ are positive. The first Chern classes of these line bundles form a $\mathbb{Q}$-basis of $H^{2}\left(X_{M}^{\tau}\right)$ by the last statement in Proposition 2.14,

Proposition 2.17. If $(M, \tau)$ is a minimal toric pair, the Picard group of $X_{M}^{\tau}$ is free of rank $k$ and has a $\mathbb{Z}$-basis given by $\gamma_{1}, \ldots, \gamma_{k}$ defined by (2.16).

Proof. The first Chern class homomorphism is an isomorphism because $h^{0,1}\left(X_{M}^{\tau}\right)=h^{0,2}\left(X_{M}^{\tau}\right)=$ 0 which in turn follows from Proposition 2.14.

Remark 2.18. If $(M, \tau)$ is a toric pair, there is a short exact sequence

$$
\begin{equation*}
0 \longrightarrow \mathcal{O}_{X_{M}^{\tau}}^{\oplus k} \xrightarrow{F} \bigoplus_{j=1}^{N} L_{-M_{j}} \xrightarrow{G} T X_{M}^{\tau} \longrightarrow 0 . \tag{2.19}
\end{equation*}
$$

Specifically, we can take

$$
\begin{array}{rlrl}
F\left([z], e_{i}\right) & \equiv\left[z, m_{i 1} z_{1}, m_{i 2} z_{2}, \ldots, m_{i N} z_{N}\right] & & \forall i \in[k],[z] \in X_{M}^{\tau}, \\
G\left(z, y_{1}, \ldots, y_{N}\right) & \equiv \sum_{j=1}^{N} y_{j} \mathrm{~d}_{z} \pi\left(\left.\frac{\partial}{\partial z_{j}}\right|_{z}\right), & \forall z \in \widetilde{X}_{M}^{\tau}, y_{1}, \ldots, y_{N} \in \mathbb{C},
\end{array}
$$

where $\left\{e_{i}: i \in[k]\right\}$ is the standard basis for $\mathbb{C}^{k}$ and $\pi: \widetilde{X}_{M}^{\tau} \longrightarrow X_{M}^{\tau}$ is the projection. Thus,

$$
\begin{equation*}
c_{1}\left(T X_{M}^{\tau}\right)=\sum_{j=1}^{N} \mathrm{U}_{j} . \tag{2.20}
\end{equation*}
$$

### 2.3 Torus action and equivariant notation

The equivariant cohomology of a topological space $X$ endowed with a continuous $\mathbb{T}^{N}$-action is

$$
H_{\mathbb{T}^{N}}^{*}(X) \equiv H^{*}\left(E \mathbb{T}^{N} \times_{\mathbb{T}^{N}} X\right),
$$

where $E \mathbb{T}^{N} \equiv\left(\mathbb{C}^{\infty}-0\right)^{N}$ is the classifying space for $\mathbb{T}^{N}$. In particular, the equivariant cohomology of a point is

$$
H_{\mathbb{T}^{N}}^{*}(\text { point }) \cong H_{\mathbb{T}^{N}}^{*} \equiv H^{*}\left(\left(\mathbb{P}^{\infty}\right)^{N}\right)=\mathbb{Q}\left[\alpha_{1}, \ldots, \alpha_{N}\right] \equiv \mathbb{Q}[\alpha]
$$

where $\alpha_{j} \equiv c_{1}\left(\pi_{j}^{*} \mathcal{O}_{\mathbb{P} \infty}(1)\right), \pi_{j}:\left(\mathbb{P}^{\infty}\right)^{N} \longrightarrow \mathbb{P}^{\infty}$ is the projection onto the $j$-th component and $\mathcal{O}_{\mathbb{P}^{\infty}}(1)$ is dual to the tautological line bundle over $\mathbb{P}^{\infty}$. The equivariant Euler class of an oriented vector bundle $V \longrightarrow X$ endowed with a lift of the $\mathbb{T}^{N}$-action on $X$ is

$$
\mathbf{e}(V) \equiv e\left(E \mathbb{T}^{N} \times_{\mathbb{T}^{N}} V\right) \in H_{\mathbb{T}^{N}}^{*}(X)
$$

A $\mathbb{T}^{N}$-equivariant map $f: X \longrightarrow Y$ between compact oriented manifolds induces a pushforward map

$$
f_{*}: H_{\mathbb{T}^{N}}^{s}(X) \longrightarrow H_{\mathbb{T}^{N}}^{s+\operatorname{dim} Y-\operatorname{dim} X}(Y)
$$

characterized by

$$
\begin{equation*}
\int_{X}\left(f^{*} \eta\right) \eta^{\prime}=\int_{Y} \eta\left(f_{*} \eta^{\prime}\right) \quad \forall \eta \in H_{\mathbb{T}^{N}}^{*}(Y), \eta^{\prime} \in H_{\mathbb{T}^{N}}^{*}(X) . \tag{2.21}
\end{equation*}
$$

If $Y$ is a point, $f_{*}$ is the integration along the fiber homomorphism $\int_{X}: H_{\mathbb{T}^{N}}^{s}(X) \longrightarrow H_{\mathbb{T}^{N}}^{s-\operatorname{dim} X}$. The push-forward map $f_{*}$ extends to a homomorphism between the modules of fractions with denominators in $\mathbb{Q}[\alpha]$; in particular, the integration along the fiber homomorphism extends to

$$
\int_{X}: H_{\mathbb{T}^{N}}^{*}(X) \otimes_{\mathbb{Q}[\alpha]} \mathbb{Q}(\alpha) \longrightarrow \mathbb{Q}(\alpha), \quad \text { where } \quad \mathbb{Q}(\alpha) \equiv \mathbb{Q}\left(\alpha_{1}, \ldots, \alpha_{N}\right)
$$

is the field of fractions of $\mathbb{Q}[\alpha]$. If $X$ is a compact oriented manifold on which $\mathbb{T}^{N}$ acts smoothly, then, by the classical Localization Theorem ABO]

$$
\begin{equation*}
\mathbb{Q}[\alpha] \ni \int_{X} \eta=\sum_{F \subset X^{\mathbb{T}}} \int_{F} \frac{\eta}{\mathbf{e}\left(N_{F / X}\right)} \in \mathbb{Q}(\alpha), \quad \forall \eta \in H_{\mathbb{T}^{N}}^{*}(X), \tag{2.22}
\end{equation*}
$$

where the sum runs over the components of the $\mathbb{T}^{N}$ pointwise fixed locus $X^{\mathbb{T}^{N}}$ of $X$.
Lemma 2.19. If $(M, \tau)$ is a toric pair, $\left(\mathbb{T}^{N} \cdot z / \mathbb{T}^{k}\right)$ is diffeomorphic to $\mathbb{T}^{|\operatorname{supp}(z)|-k}$ for every $z \in \widetilde{X}_{M}^{\tau}$.

Proof. By Lemma 2.4(i) and (ii) in Definition 2.1, there exists $J \subseteq \operatorname{supp}(z)$ with $|J|=k$ and $\operatorname{det} M_{J} \in\{ \pm 1\}$. The map

$$
\frac{\mathbb{T}^{N} \cdot z}{\mathbb{T}^{k}} \ni\left[y_{1}, \ldots, y_{N}\right] \longrightarrow\left(y_{J}^{-M_{J}^{-1} M_{s}} y_{s}\right)_{s \in \operatorname{supp}(z)-J} \in \mathbb{T}^{|\operatorname{supp}(z)|-k}
$$

is a diffeomorphism with inverse

$$
\mathbb{T}^{|\operatorname{supp}(z)|-k} \ni \lambda \longrightarrow\left[t_{1} z_{1}, \ldots, t_{N} z_{N}\right] \in \frac{\mathbb{T}^{N} \cdot z}{\mathbb{T}^{k}}, \quad \text { where } \quad t_{j} \equiv \begin{cases}1, & \text { if } j \notin \operatorname{supp}(z), \\ \frac{\lambda_{s}}{z_{s}}, & \text { if } j=j_{s}, \\ \frac{1}{z_{j}}, & \text { if } j \in J,\end{cases}
$$

and $\operatorname{supp}(z)-J \equiv\left\{j_{1}<\ldots<j_{|\operatorname{supp}(z)|-k}\right\}$; see the proof of Lemma 2.5 $h$ in Section 2.1.
Corollary 2.20. (a) The $\mathbb{T}^{N}$-fixed points in $X_{M}^{\tau}$ are the points $[J]$ of (2.13).
(b) The closed $\mathbb{T}^{N}$-fixed curves in $X_{M}^{\tau}$ are the submanifolds $X_{M}^{\tau}(J)$ of Remark 2.10 with $|J|=k+1$; all such tuples $J$ are of the form $J=I_{1} \cup I_{2}$ with with $I_{1}, I_{2} \in \mathscr{V}_{M}^{\tau}$ and $\left|I_{1} \cap I_{2}\right|=k-1$. These curves are biholomorphic to $\mathbb{P}^{1}$.

Proof. The first two statements follow from Lemma 2.19, The third follows from the last part of Remark 2.10. The last follows from Remarks 2.10 and 2.12.

We next consider lifts of the standard action of $\mathbb{T}^{N}$ on $X_{M}^{\tau}$ to the line bundles $L_{\mathbf{p}}$ of (2.14) which will be used in describing the equivariant cohomology of $X_{M}^{\tau}$. One such lift is the canonical one

$$
\begin{equation*}
\left(t_{1}, \ldots, t_{N}\right) \cdot\left[z_{1}, \ldots, z_{N}, c\right] \equiv\left[t_{1} z_{1}, \ldots, t_{N} z_{N}, c\right] \tag{2.23}
\end{equation*}
$$

for all $\left(t_{1}, \ldots, t_{N}\right) \in \mathbb{T}^{N},\left(z_{1}, \ldots, z_{N}\right) \in \widetilde{X}_{M}^{\tau}$, and $c \in \mathbb{C}$. We denote by

$$
E \mathbb{T}^{N} \times_{\text {triv }} L_{\mathbf{p}} \longrightarrow E \mathbb{T}^{N} \times_{\mathbb{T}^{N}} X_{M}^{\tau}
$$

the induced line bundle. Another lift is given by

$$
\begin{equation*}
\left(t_{1}, \ldots, t_{N}\right) \cdot\left[z_{1}, \ldots, z_{N}, c\right] \equiv\left[t_{1} z_{1}, \ldots, t_{N} z_{N}, t_{j} c\right] \tag{2.24}
\end{equation*}
$$

for all $\left(t_{1}, \ldots, t_{N}\right) \in \mathbb{T}^{N},\left(z_{1}, \ldots, z_{N}\right) \in \widetilde{X}_{M}^{\tau}$, and $c \in \mathbb{C}$. We denote by

$$
E \mathbb{T}^{N} \times_{j} L_{\mathbf{p}} \longrightarrow E \mathbb{T}^{N} \times_{\mathbb{T}^{N}} X_{M}^{\tau}
$$

the induced line bundle. These line bundles are related by isomorphisms

$$
\begin{align*}
\left(E \mathbb{T}^{N} \times_{\text {triv }} L_{\mathbf{p}}\right) \otimes\left(E \mathbb{T}^{N} \times_{j} L_{0}\right) & \cong E \mathbb{T}^{N} \times_{j} L_{\mathbf{p}},  \tag{2.25}\\
E \mathbb{T}^{N} \times_{j} L_{0} & \cong \operatorname{pr}_{1}^{*} \pi_{j}^{*} \mathcal{O}_{\mathbb{P} \infty}(-1), \tag{2.26}
\end{align*}
$$

where $\operatorname{pr}_{1}: E \mathbb{T}^{N} \times_{\mathbb{T}^{N}} X_{M}^{\tau} \longrightarrow\left(\mathbb{P}^{p \infty}\right)^{N}$ denotes the natural projection. The first of these follows by considering the isomorphism

$$
L_{\mathbf{p}} \otimes L_{0} \longrightarrow L_{\mathbf{p}}, \quad\left[z, c_{1}\right] \otimes\left[z, c_{2}\right] \longrightarrow\left[z, c_{1} c_{2}\right] \quad \forall z \in \widetilde{X}_{M}^{\tau}, c_{1}, c_{2} \in \mathbb{C}
$$

which is $\mathbb{T}^{N}$-equivariant with respect to the $\mathbb{T}^{N}$ action on $L_{\mathbf{p}} \otimes L_{0}$ obtained by tensoring (2.23) with (2.24) and the action (2.24) on $L_{\mathbf{p}}$. The second is given by

$$
E \mathbb{T}^{N} \times_{j} L_{0} \ni(e, z, c) \longrightarrow\left(e, z, c e_{j}\right) \in \operatorname{pr}_{1}^{*} \pi_{j}^{*} \mathcal{O}_{\mathbb{P}^{\infty}}(-1) \quad \forall e=\left(e_{1}, \ldots, e_{N}\right) \in E \mathbb{T}^{N}, z \in \widetilde{X}_{M}^{\tau}, c \in \mathbb{C} .
$$

For all $j \in[N], i \in[k]$ and with $\gamma_{i}$ defined by (2.16), let

$$
\begin{equation*}
\left[\mathbf{D}_{\mathbf{j}}\right] \equiv E \mathbb{T}^{N} \times_{j} L_{-M_{j}}, \quad \boldsymbol{\gamma}_{i} \equiv E \mathbb{T}^{N} \times_{\text {triv }} \gamma_{i} ; \quad u_{j} \equiv c_{1}\left(\left[\mathbf{D}_{\mathbf{j}}\right]\right), \quad x_{i} \equiv c_{1}\left(\gamma_{i}^{*}\right) \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right) \tag{2.27}
\end{equation*}
$$

For each $J \in \mathscr{V}_{M}^{\tau}$, the inclusion $[J] \hookrightarrow X_{M}^{\tau}$ induces a restriction map

$$
\begin{equation*}
\cdot(J),\left.\cdot\right|_{J}: H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right) \longrightarrow H_{\mathbb{T}^{N}}^{*}([J]) \cong H_{\mathbb{T}^{N}}^{*} . \tag{2.28}
\end{equation*}
$$

By (2.17), (2.25) and (2.26),

$$
\begin{equation*}
u_{j}=\sum_{i=1}^{k} m_{i j} x_{i}-\alpha_{j} \quad \forall j \in[N] . \tag{2.29}
\end{equation*}
$$

For each $j \in[N]$, the section (2.15) of $L_{-M_{j}} \longrightarrow X_{M}^{\tau}$ is $\mathbb{T}^{N}$-equivariant with respect to the action (2.24) and thus induces a section $\mathbf{s}_{j}$ of $\left[\mathbf{D}_{j}\right]$ over $E \mathbb{T}^{N} \times \mathbb{T}^{N} X_{M}^{\tau}$. If $J \in \mathscr{V}_{M}^{\tau}$ and $j \in J$, $\mathrm{s}_{j}$ does not vanish on $E \mathbb{T}^{N} \times_{\mathbb{T}^{N}}[J]$ and thus

$$
\begin{equation*}
J \in \mathscr{V}_{M}^{\tau} \quad \Longrightarrow \quad u_{j}(J)=0 \quad \forall j \in J . \tag{2.30}
\end{equation*}
$$

On the other hand, if $J \in \mathcal{E}_{M}^{\tau}$, with $\mathcal{E}_{M}^{\tau}$ defined by (2.18), then $\bigoplus_{j \in J} \mathbf{s}_{j}$ is a nowhere zero section of $\oplus_{j \in J}\left[\mathbf{D}_{j}\right]$ and thus

$$
\begin{equation*}
J \in \mathcal{E}_{M}^{\tau} \quad \Longrightarrow \quad \prod_{j \in J} u_{j}=0 \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right) \tag{2.31}
\end{equation*}
$$

Proposition 2.21. Let $(M, \tau)$ be a toric pair.
(a) If $J=\left(j_{1}<\ldots<j_{k}\right) \in \mathscr{V}_{M}^{\tau}$,

$$
\left(x_{1}(J) x_{2}(J) \ldots x_{k}(J)\right)=\left(\begin{array}{lll}
\alpha_{j_{1}} & \alpha_{j_{2}} \ldots & \alpha_{j_{k}}
\end{array}\right) M_{J}^{-1}
$$

(b) With $x_{i}$ and $u_{j}$ defined by (2.27),

$$
\begin{equation*}
H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right)=\frac{\mathbb{Q}[\alpha]\left[x_{1}, x_{2}, \ldots, x_{k}, u_{1}, u_{2}, \ldots, u_{N}\right]}{\left(u_{j}-\sum_{i=1}^{k} m_{i j} x_{i}+\alpha_{j}, \quad 1 \leqslant j \leqslant N\right)+\left(\prod_{j \in J} u_{j}: J \in \mathcal{E}_{M}^{\tau}\right)} \tag{2.32}
\end{equation*}
$$

If in addition $P \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right)$, then $P=0$ if and only if $P(J)=0$ for all $J \in \mathscr{V}_{M}^{\tau}$.
Proof. (a) This follows from (2.29) and (2.30).
(b) By Remark [2.15, there exists $B \subset\left(\mathbb{Z}^{\geqslant 0}\right)^{k}$ such that $\left\{\mathrm{H}^{\mathbf{p}}: \mathbf{p} \in B\right\}$ is a $\mathbb{Q}$-basis for $H^{*}\left(X_{M}^{\tau}\right)$. The map

$$
H^{*}\left(X_{M}^{\tau}\right) \ni \mathrm{H}^{\mathbf{p}} \longrightarrow x^{\mathbf{p}} \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right) \quad \forall \mathbf{p} \in B
$$

defines a cohomology extension of the fiber for the fiber bundle $E \mathbb{T}^{N} \times \mathbb{T}^{N} X_{M}^{\tau} \longrightarrow\left(\mathbb{P}^{\infty}\right)^{N}$. Thus, by the Leray-Hirsch Theorem [Spa, Chapter 5], the map

$$
H_{\mathbb{T}^{N}}^{*} \otimes H^{*}\left(X_{M}^{\tau}\right) \ni P \otimes \mathrm{H}^{\mathbf{p}} \longrightarrow P x^{\mathbf{p}} \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right) \quad \forall \mathbf{p} \in B
$$

is an isomorphism of vector spaces. The relations in (2.32) hold by (2.29) and (2.31). We show below that there are no other relations and simultaneously verify the last claim.

Suppose $P \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right), P(J)=0$ for all $J \in \mathscr{V}_{M}^{\tau}$. By (ii) in Definition [2.1, any element $P$ of $H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right)$ is a polynomial in $u_{1}, \ldots, u_{N}$ with coefficients in $\mathbb{Q}[\alpha]$. If $J \in \mathscr{V}_{M}^{\tau}$ and $j \in[N]-J$, then

$$
\begin{equation*}
\left.u_{j}(J)\right|_{\alpha_{i}=0 \forall i \in J}=-\alpha_{j} \tag{2.33}
\end{equation*}
$$

by (2.29) and (a), By (2.30) and (2.33), whenever $u_{i_{1}}^{a_{1}} \ldots u_{i_{s}}^{a_{s}}$ is a monomial appearing in $P$ and $J \in \mathscr{V}_{M}^{\tau},\left\{i_{1}, \ldots, i_{s}\right\} \cap J \neq \varnothing$. This shows that

$$
P \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right), P(J)=0 \quad \forall J \in \mathscr{V}_{M}^{\tau} \quad \Longrightarrow \quad P \in \mathbf{H}^{\prime}
$$

where $\mathbf{H}^{\prime}$ is the ideal

$$
\mathbf{H}^{\prime} \equiv\left(u_{i_{1}} \ldots u_{i_{s}}:\left\{i_{1}, \ldots, i_{s}\right\} \cap J \neq \varnothing \forall J \in \mathscr{V}_{M}^{\tau}\right) \subset \mathbb{Q}[\alpha]\left[u_{1}, \ldots, u_{N}\right] .
$$

Since $\mathbf{H}^{\prime} \subseteq\left(\prod_{j \in J} u_{j}: J \in \mathcal{E}_{M}^{\tau}\right)$ by Lemma 2.4) (i),

$$
P \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right), P(J)=0 \quad \forall J \in \mathscr{V}_{M}^{\tau} \quad \Longrightarrow \quad P \in\left(\prod_{j \in J} u_{j}: J \in \mathcal{E}_{M}^{\tau}\right) .
$$

By (2.31), this implies that $P=0 \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right)$ if $P(J)=0$ for all $J \in \mathscr{V}_{M}^{\tau}$.
For every $J \in \mathscr{V}_{M}^{\tau}$, let

$$
\phi_{J} \equiv \prod_{j \in[N]-J} u_{j} .
$$

By (2.19) and (2.30),

$$
\begin{equation*}
\phi_{J}(J)=\mathbf{e}\left(T_{[J]} X_{M}^{\tau}\right), \quad \phi_{J}(I)=0 \quad \forall I \in \mathscr{V}_{M}^{\tau}-\{J\} . \tag{2.34}
\end{equation*}
$$

Thus, by the Localization Theorem (2.22),

$$
\begin{equation*}
\int_{X_{M}^{\tau}} P \phi_{J}=P(J) \quad \forall P \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right), J \in \mathscr{V}_{M}^{\tau}, \tag{2.35}
\end{equation*}
$$

i.e. $\phi_{J}$ is the equivariant Poincaré dual of the point $[J] \in X_{M}^{\tau}$.

### 2.4 Examples

Example 2.22 (the complex projective space $\mathbb{P}^{N-1}$ with the standard action of $\mathbb{T}^{N}$ ). If

$$
M \equiv(1, \ldots, 1) \in \mathbb{R}^{N} \quad \text { and } \quad \tau \in \mathbb{R}^{>0}
$$

then

$$
\mu_{M}: \mathbb{C}^{N} \longrightarrow \mathbb{R}, \quad \mu_{M}(z)=\left|z_{1}\right|^{2}+\ldots+\left|z_{N}\right|^{2}, \quad P_{M}^{\tau}=\left\{v \in\left(\mathbb{R}^{\geqslant 0}\right)^{N}: v_{1}+\ldots+v_{N}=\tau\right\},
$$

$(M, \tau)$ is a minimal toric pair, $\tilde{X}_{M}^{\tau}=\mathbb{C}^{N}-\{0\}$,

$$
X_{M}^{\tau}=\mathbb{P}^{N-1} \cong\left(S^{2 n-1}(\sqrt{\tau})\right) / S^{1}, \quad H_{\mathbb{T}^{N}}^{*}\left(\mathbb{P}^{N-1}\right) \cong \mathbb{Q}\left[\alpha_{1}, \ldots, \alpha_{N}\right][x] / \prod_{k=1}^{N}\left(x-\alpha_{k}\right) .
$$

Example 2.23 (the Hirzebruch surfaces $\left.\mathbb{F}_{k} \equiv \mathbb{P}\left(\mathcal{O}_{\mathbb{P}^{1}} \oplus \mathcal{O}_{\mathbb{P}^{1}}(k)\right)\right)$. If $k \geqslant 0$,

$$
M \equiv\left(\begin{array}{cccc}
0 & 0 & 1 & 1 \\
1 & 1 & 0 & k
\end{array}\right), \quad \tau \equiv\binom{1}{k+1}
$$

then

$$
\begin{aligned}
& \left(t_{1}, t_{2}\right) \cdot\left(z_{1}, z_{2}, z_{3}, z_{4}\right) \equiv\left(t_{2} z_{1}, t_{2} z_{2}, t_{1} z_{3}, t_{1} t_{2}^{k} z_{4}\right), \\
& \mu_{M}: \mathbb{C}^{4} \longrightarrow \mathbb{R}^{2}, \quad \mu_{M}(z) \equiv\binom{\left|z_{3}\right|^{2}+\left|z_{4}\right|^{2}}{\left|z_{1}\right|^{2}+\left|z_{2}\right|^{2}+k\left|z_{4}\right|^{2}}, \\
& P_{M}^{\tau}=\left\{v \in\left(\mathbb{R}^{\geqslant 0}\right)^{4}: v_{3}+v_{4}=1, v_{1}+v_{2}+k v_{4}=k+1\right\},
\end{aligned}
$$

$(M, \tau)$ is a minimal toric pair,

$$
\tilde{X}_{M}^{\tau}=\mathbb{C}^{4}-\left(\mathbb{C}^{2} \times 0 \cup 0 \times \mathbb{C}^{2}\right), \quad X_{M}^{\tau}=\tilde{X}_{M}^{\tau} / \mathbb{T}^{2}
$$

The map

$$
\begin{equation*}
X_{M}^{\tau} \xrightarrow{\sim} \mathbb{F}_{k}, \quad\left[z_{1}, z_{2}, z_{3}, z_{4}\right] \longrightarrow\left[\left[z_{1}, z_{2}\right], z_{3},\left(\left(z_{1}, z_{2}\right)^{\otimes k} \longrightarrow z_{4}\right)\right], \tag{2.36}
\end{equation*}
$$

is a $\mathbb{T}^{4}$-equivariant biholomorphism with respect to the action of $\mathbb{T}^{4}$ on $\mathbb{F}_{k}$ given by

$$
\begin{array}{r}
\left(t_{1}, t_{2}, t_{3}, t_{4}\right) \cdot\left[\left[z_{1}, z_{2}\right], z_{3}, \varphi\right] \equiv\left[\left[t_{1} z_{1}, t_{2} z_{2}\right], t_{3} z_{3},\left(t_{1} y_{1}, t_{2} y_{2}\right)^{\otimes k} \longrightarrow t_{4} \varphi\left(\left(y_{1}, y_{2}\right)^{\otimes k}\right)\right], \\
\forall\left[z_{1}, z_{2}\right] \in \mathbb{P}^{1}, z_{3} \in \mathbb{C},\left.\varphi \in \mathcal{O}_{\mathbb{P}^{1}}(k)\right|_{\left[z_{1}, z_{2}\right]} .
\end{array}
$$

By Proposition 2.14,

$$
\begin{aligned}
H^{*}\left(\mathbb{F}_{k}\right) & =\frac{\mathbb{Q}\left[\mathrm{H}_{1}, \mathrm{H}_{2}, \mathrm{U}_{1}, \mathrm{U}_{2}, \mathrm{U}_{3}, \mathrm{U}_{4}\right]}{\left(\mathrm{U}_{1}-\mathrm{H}_{2}, \mathrm{U}_{2}-\mathrm{H}_{2}, \mathrm{U}_{3}-\mathrm{H}_{1}, \mathrm{U}_{4}-\mathrm{H}_{1}-k \mathrm{H}_{2}\right)+\left(\mathrm{U}_{1} \mathrm{U}_{2}, \mathrm{U}_{3} \mathrm{U}_{4}\right)} \\
& \cong \frac{\mathbb{Q}\left[\mathrm{H}_{1}, \mathrm{H}_{2}\right]}{\left(\mathrm{H}_{2}^{2}, \mathrm{H}_{1}\left(\mathrm{H}_{1}+k \mathrm{H}_{2}\right)\right)}
\end{aligned}
$$

Since the toric hypersurfaces $D_{2}$ and $D_{3}$ defined by (2.12) intersect at one point,

$$
\mathrm{H}_{1} \mathrm{H}_{2}=\mathrm{U}_{2} \mathrm{U}_{3}=1, \quad \mathrm{H}_{1}^{2}=-k \mathrm{H}_{1} \mathrm{H}_{2}=-k .
$$

The isomorphism (2.36) maps $D_{4}$ onto $E_{0}$ and $D_{3}$ onto $E_{\infty}$, where

$$
\begin{aligned}
E_{0} & \equiv \text { image of the section }(1,0) \text { in } \mathbb{F}_{k}, \\
E_{\infty} & \equiv \text { closure of the image of }(0, \sigma) \text { in } \mathbb{F}_{k},
\end{aligned}
$$

where $\sigma$ is any non-zero holomorphic section of $\mathcal{O}_{\mathbb{P}^{1}}(k)$.
Since $\mathscr{V}_{M}^{\tau}=\{(1,3),(1,4),(2,3),(2,4)\}$, by Corollary 2.20, the $\mathbb{T}^{4}$-fixed points in $X_{M}^{\tau}$ are

$$
[1,0,1,0],[1,0,0,1],[0,1,1,0], \quad \text { and } \quad[0,1,0,1]
$$

while the closed $\mathbb{T}^{4}$-fixed curves are all 4 toric hypersurfaces $D_{1}, D_{2}, D_{3}$, and $D_{4}$. By Proposition 2.21)(b),

$$
H_{\mathbb{T}^{4}}^{*}\left(\mathbb{F}_{k}\right) \equiv \frac{\mathbb{Q}\left[\alpha_{1}, \alpha_{2}, \alpha_{3}, \alpha_{4}\right]\left[x_{1}, x_{2}\right]}{\left(\left(x_{2}-\alpha_{1}\right)\left(x_{2}-\alpha_{2}\right),\left(x_{1}-\alpha_{3}\right)\left(x_{1}+k x_{2}-\alpha_{4}\right)\right)} .
$$

Example 2.24 (products). Let $\left(M_{1}, \tau_{1}\right)$ and $\left(M_{2}, \tau_{2}\right)$ be (minimal) toric pairs, where $M_{j}$ is a $k_{j} \times N_{j}$ matrix. Define

$$
M_{1} \oplus M_{2} \equiv\left(\begin{array}{cc}
M_{1} & 0 \\
0 & M_{2}
\end{array}\right) .
$$

Then, $\left(M_{1} \oplus M_{2},\left(\tau_{1}, \tau_{2}\right)\right)$ is a (minimal) toric pair,

$$
P_{M_{1} \oplus M_{2}}^{\left(\tau_{1}, \tau_{2}\right)}=P_{M_{1}}^{\tau_{1}} \times P_{M_{2}}^{\tau_{2}}, \quad \text { and } \quad \widetilde{X}_{M_{1} \oplus M_{2}}^{\left(\tau_{1}, \tau_{2}\right)}=\widetilde{X}_{M_{1}}^{\tau_{1}} \times \widetilde{X}_{M_{2}}^{\tau_{2}}
$$

The projections $\pi_{j}: \mathbb{C}^{N_{1}+N_{2}} \longrightarrow \mathbb{C}^{N_{j}}$ induce a $\mathbb{T}^{N_{1}+N_{2}}$-equivariant biholomorphism

$$
X_{M_{1} \oplus M_{2}}^{\left(\tau_{1}, \tau_{2}\right)} \ni[z] \xrightarrow{\sim}\left(\left[\pi_{1}(z)\right],\left[\pi_{2}(z)\right]\right) \in X_{M_{1}}^{\tau_{1}} \times X_{M_{2}}^{\tau_{2}},
$$

where the action of $\mathbb{T}^{N_{1}+N_{2}}$ on $X_{M_{1}}^{\tau_{1}} \times X_{M_{2}}^{\tau_{2}}$ is the product of the standard actions of $\mathbb{T}^{N_{1}}$ on $X_{M_{1}}^{\tau_{1}}$ and of $\mathbb{T}^{N_{2}}$ on $X_{M_{2}}^{\tau_{2}}$. By (2.4) and Lemma 2.4 (a) (g),

$$
\mathscr{V}_{M_{1} \oplus M_{2}}^{\left(\tau_{1}, \tau_{2}\right)}=\mathscr{V}_{M_{1}}^{\tau_{1}} \times \mathscr{V}_{M_{2}}^{\tau_{2}}
$$

Thus, by Corollary 2.2q](a), the $\mathbb{T}^{N_{1}+N_{2}}$-fixed points of $X_{M_{1} \oplus M_{2}}^{\left(\tau_{1}, \tau_{2}\right)}$ are the points $\left(\left[I_{1}\right],\left[I_{2}\right]\right)$ for all $I_{j} \in \mathscr{V}_{M_{j}}^{\tau_{j}}$, with $\left[I_{j}\right]$ defined by (2.13). By Corollary $\left.2.2 q(b)\right]$ and the second statement in Lemma 2.4](b), the closed $\mathbb{T}^{N_{1}+N_{2}}$-fixed curves in $X_{M_{1} \oplus M_{2}}^{\left(\tau_{1}, \tau_{2}\right)}$ are all curves of the form $C_{1} \times\left[I_{2}\right]$ and $\left[I_{1}\right] \times C_{2}$, where $C_{j}$ is any closed $\mathbb{T}^{N_{j}}$-fixed curve in $X_{M_{j}}^{\tau_{j}}$ and $I_{j} \in \mathscr{V}_{M_{j}}^{\tau_{j}}$ is arbitrary.

In particular, $\mathbb{P}^{N_{1}-1} \times \ldots \times \mathbb{P}^{N_{s}-1}$ is given by the minimal toric pair

By Proposition 2.21](b),

$$
\begin{equation*}
H_{\mathbb{T}^{N}}^{*}\left(\mathbb{P}^{N_{1}-1} \times \ldots \times \mathbb{P}^{N_{s}-1}\right)=\frac{\mathbb{Q}\left[\alpha_{j}^{(i)}, 1 \leqslant i \leqslant s, 1 \leqslant j \leqslant N_{i}\right]\left[x_{1}, \ldots, x_{s}\right]}{\left(\prod_{j=1}^{N_{i}}\left(x_{i}-\alpha_{j}^{(i)}\right), 1 \leqslant i \leqslant s\right)} . \tag{2.38}
\end{equation*}
$$

Remark 2.25. Let $\sigma:[N] \longrightarrow[N]$ be a permutation and $(M, \tau)$ be a (minimal) toric pair. Let

$$
M^{\sigma} \equiv\left(m_{i \sigma(j)}\right)_{\substack{1 \leqslant i \leqslant k \\ 1 \leqslant j \leqslant N}} \equiv M \circ \operatorname{Id}^{\sigma}
$$

be the matrix obtained from $M$ by permuting its columns as dictated by $\sigma$. Then $\left(M^{\sigma}, \tau\right)$ is a (minimal) toric pair as well and $\mathrm{Id}^{\sigma^{-1}}$ induces a biholomorphism between $X_{M}^{\tau}$ and $X_{M^{\sigma}}^{\tau}$ (since $\mu_{M^{\sigma}}=\mu_{M} \circ \mathrm{Id}^{\sigma}$ ) equivariant with respect to

$$
\mathbb{T}^{N} \longrightarrow \mathbb{T}^{N}, \quad\left(t_{1}, t_{2}, \ldots, t_{N}\right) \longrightarrow\left(t_{\sigma(1)}, t_{\sigma(2)}, \ldots, t_{\sigma(N)}\right) .
$$

In particular, taking $k=0$ in Example 2.23 gives - via (2.37) - $\mathbb{P}^{1} \times \mathbb{P}^{1}$ as expected, since the corresponding matrices differ by a permutation of columns.

## Chapter 3

## Explicit Gromov-Witten formulas

For the remaining part of this dissertation, $X_{M}^{\tau}$ is the compact projective manifold defined by (2.2), where $(M, \tau)$ is a minimal toric pair as in Definition [2.1. Theorem 3.5 in Section 3.2 below computes the one-point GW generating functions $\dot{Z}_{\eta}$ and $\ddot{Z}_{\eta}$ of (1.9) if $\eta \in H^{*}\left(X_{M}^{\tau}\right)$ is of the form $\eta=\mathrm{H}^{\mathbf{p}}$, where $\left\{\mathrm{H}_{1}, \ldots, \mathrm{H}_{k}\right\}$ is the basis for $H^{2}\left(X_{M}^{\tau} ; \mathbb{Z}\right)$ referred to in Proposition 2.14] and

$$
\mathrm{H}^{\mathbf{p}} \equiv \mathrm{H}_{1}^{p_{1}} \ldots \mathrm{H}_{k}^{p_{k}} \quad \forall \mathbf{p}=\left(p_{1}, \ldots, p_{k}\right) \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k}
$$

We denote

$$
\begin{equation*}
\dot{Z}_{\mathbf{p}} \equiv \dot{Z}_{\mathrm{H}^{\mathrm{p}}} \quad \text { and } \quad \ddot{Z}_{\mathbf{p}} \equiv \ddot{Z}_{\mathrm{H}^{\mathrm{p}}} \tag{3.1}
\end{equation*}
$$

Section 3.1] constructs the explicit formal power series in terms of which $\dot{Z}_{\mathbf{p}}$ and $\ddot{Z}_{\mathbf{p}}$ are expressed in Theorem 3.5. Throughout this construction, which extends the constructions in [Z1, Section 2.3] and [PoZ, Sections 2,3.1] from $\mathbb{P}^{n-1}$ to an arbitrary toric manifold $X_{M}^{\tau}$, we assume that

$$
\begin{equation*}
\nu_{E}(\mathbf{d}) \geqslant 0 \quad \forall \mathbf{d} \in \Lambda \tag{3.2}
\end{equation*}
$$

with $\nu_{E}$ as in (3.3), and identify

$$
H_{2}\left(X_{M}^{\tau} ; \mathbb{Z}\right) \cong \mathbb{Z}^{k}
$$

via the basis $\left\{\mathrm{H}_{1}, \ldots, \mathrm{H}_{k}\right\}$. Via this identification $\Lambda \hookrightarrow \mathbb{Z}^{k}$, with $\Lambda$ as in (1.6).

### 3.1 Notation and construction of explicit power series

If $R$ is a ring, we denote by $R \llbracket \hbar \rrbracket$ the ring of formal Laurent series in $\hbar^{-1}$ with finite principal part:

$$
R \| \hbar \pi \equiv R\left[\left[\hbar^{-1}\right]\right]+R[\hbar] .
$$

Given $f, g \in R \| \hbar \Pi$ and $s \in \mathbb{Z}^{\geqslant 0}$, we write

$$
f \cong g \quad \bmod \hbar^{-s} \quad \text { if } \quad f-g \in R[\hbar]+\left\{\sum_{i=1}^{s-1} a_{i} \hbar^{-i}: a_{i} \in R \quad \forall i \in[s-1]\right\}
$$

If $R$ is a field, we view $R(\hbar)$ as a subring of $R \Pi \hbar \rrbracket$ by associating to each element of $R(\hbar)$ its Laurent series at $\hbar^{-1}=0$.

With the line bundles $L_{i}^{ \pm}$as in (1.5) and $\mathrm{U}_{j}$ as in (2.16) and $\mathbf{d} \in H_{2}\left(X_{M}^{\tau} ; \mathbb{Z}\right)$, we define

$$
\begin{align*}
D_{j}(\mathbf{d}) \equiv\left\langle\mathrm{U}_{j}, \mathbf{d}\right\rangle, \quad L_{i}^{ \pm}(\mathbf{d}) \equiv\left\langle c_{1}\left(L_{i}^{ \pm}\right), \mathbf{d}\right\rangle, \\
\nu_{E}(\mathbf{d}) \equiv \sum_{j=1}^{N} D_{j}(\mathbf{d})-\sum_{i=1}^{a} L_{i}^{+}(\mathbf{d})+\sum_{i=1}^{b} L_{i}^{-}(\mathbf{d}) .3^{3} \tag{3.3}
\end{align*}
$$

If in addition $Y \subset X$ is a one-dimensional submanifold, let

$$
D_{j}(Y) \equiv D_{j}\left([Y]_{X_{M}^{\tau}}\right), \quad L_{i}^{ \pm}(Y) \equiv L_{i}^{ \pm}\left([Y]_{X_{M}^{\tau}}^{\tau}\right),
$$

where $[Y]_{X_{M}^{\tau}} \in H_{2}\left(X_{M}^{\tau} ; \mathbb{Z}\right)$ is the homology class represented by $Y$. By (2.20), our assumption (3.2), and Footnote 2,

$$
c_{1}\left(T X_{M}^{\tau}\right)-\sum_{i=1}^{a} c_{1}\left(L_{i}^{+}\right)+\sum_{i=1}^{b} c_{1}\left(L_{i}^{-}\right) \in \overline{\mathcal{K}}_{M}^{\tau} .
$$

Thus, if $E \neq E^{+}$, then $X_{M}^{\tau}$ is Fano. In this case, the Cone Theorem La, Theorem 1.5.33] implies that the closed $\mathbb{R}$-cone of curves is a polytope spanned by classes of rational curves. By [La, Proposition 1.4.28] and [La, Theorem 1.4.23(i)], this closed cone is the $\mathbb{R}$-cone spanned by $\Lambda$. Thus, $L_{i}^{-}(\mathbf{d})<0$ for all $\mathbf{d} \in \Lambda-\{0\}$ and all $i \in[b] .4$

Let $R$ be a ring. Similarly to Section 1.1, we denote by $R[[\Lambda-0]]$ and $R\left[\left[\Lambda ; \nu_{E}=0\right]\right]$ the subalgebras of $R[[\Lambda]]$ given by

$$
\begin{aligned}
R[[\Lambda-0]] & \equiv\left\{\sum_{\mathbf{d} \in \Lambda} a_{\mathbf{d}} Q^{\mathbf{d}} \in R[[\Lambda]]: a_{\mathbf{0}}=0\right\}, \\
R\left[\left[\Lambda ; \nu_{E}=0\right]\right] & \equiv\left\{\sum_{\mathbf{d} \in \Lambda} a_{\mathbf{d}} Q^{\mathbf{d}} \in R[[\Lambda]]: a_{\mathbf{d}}=0 \text { if } \nu_{E}(\mathbf{d}) \neq 0\right\} .
\end{aligned}
$$

In some cases, the formal variables whose powers are indexed by $\Lambda$ within $R[[\Lambda]]$ will be denoted by $Q \equiv\left(Q_{1}, \ldots, Q_{k}\right)$ as in Section 1.1, while in other cases the formal variables will be $q \equiv\left(q_{1}, \ldots, q_{k}\right)$. If $f \in R[[\Lambda]]$ and $\mathbf{d} \in \Lambda$, we write $\llbracket f \rrbracket_{q ; \mathbf{d}} \in R$ for the coefficient of $q^{\mathbf{d}}$ in $f$. By Proposition 2.16, the set $\{\mathbf{s} \in \Lambda: \mathbf{d}-\mathbf{s} \in \Lambda\}$ is finite for every $\mathbf{d} \in \Lambda$; thus,

$$
f \in R[[\Lambda]] \text { is invertible } \Longleftrightarrow \quad \llbracket f \rrbracket_{q ; \mathbf{0}} \in R \quad \text { is invertible. }
$$

If $f \equiv \sum_{\mathbf{d} \in \Lambda} f_{\mathbf{d}} q^{\mathbf{d}} \in R[[\Lambda]]$, we define

$$
\llbracket f \rrbracket_{\nu_{E}=0} \equiv \sum_{\substack{\mathbf{d} \in \Lambda \\ \nu_{E}(\mathbf{d})=0}} f_{\mathbf{d}} q^{\mathbf{d}} \in R\left[\left[\Lambda ; \nu_{E}=0\right]\right] .
$$

[^1]Let $\mathrm{A}=\left(\mathrm{A}_{1}, \ldots, \mathrm{~A}_{k}\right)$ be a tuple of formal variables. If $f \equiv \sum_{\mathbf{d} \in \Lambda} f_{\mathbf{d}}(\mathrm{A}) q^{\mathbf{d}} \in R[[\mathrm{~A}]][[\Lambda]]$ and $p \geqslant 0$, we write

$$
\llbracket f \rrbracket_{\mathrm{A} ; p} \equiv \sum_{\mathbf{d} \in \Lambda} \llbracket f_{\mathbf{d}}(\mathrm{A}) \rrbracket_{\mathrm{A} ; p} q^{\mathbf{d}} \in R[\mathrm{~A}]_{p}[[\Lambda]],
$$

where $\llbracket f_{\mathbf{d}}(\mathrm{A}) \rrbracket_{\mathrm{A} ; p} \in R[\mathrm{~A}]$ denotes the degree $p$ homogeneous part of $f_{\mathbf{d}}(\mathrm{A})$ and $R[\mathrm{~A}]_{p}$ the space of homogeneous polynomials of degree $p$ in $\mathrm{A}_{1}, \ldots, \mathrm{~A}_{k}$ with coefficients in $R$. Finally, we write

$$
|\mathbf{p}| \equiv p_{1}+p_{2}+\ldots+p_{k} \quad \forall \mathbf{p}=\left(p_{1}, p_{2}, \ldots, p_{k}\right) \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k}
$$

For each $\mathbf{d} \in \Lambda$, let

$$
\begin{equation*}
U(\mathbf{d} ; \mathrm{A}, \hbar) \equiv \frac{\prod_{\substack{j \in[N]<0 \\ D_{j}(\mathbf{d})<0}} \prod_{\substack{j \\(\mathbf{d})+1}}^{0}\left(\sum_{i=1}^{k} m_{i j} \mathrm{~A}_{i}+s \hbar\right)}{\prod_{\substack{j \in[N] \\ D_{j}(\mathbf{d}) \geqslant 0}} \prod_{s=1}^{D_{j}(\mathbf{d})}\left(\sum_{i=1}^{k} m_{i j} \mathrm{~A}_{i}+s \hbar\right)} \in \mathbb{Q}[\mathrm{A}] \Pi \hbar \rrbracket \tag{3.4}
\end{equation*}
$$

By Proposition 2.17, the line bundles $\gamma_{i}^{*}$ of (2.16) form a basis for the Picard group of $X_{M}^{\tau}$. Thus, there are well-defined integers $\ell_{r i}^{ \pm}$such that

$$
\begin{equation*}
L_{i}^{ \pm}=\gamma_{1}^{* \ell \frac{ \pm}{1 i}} \otimes \ldots \otimes \gamma_{k}^{* \ell_{k i}^{ \pm}} \tag{3.5}
\end{equation*}
$$

With A and d as above, let

$$
\begin{align*}
& \dot{E}(\mathbf{d} ; A, \hbar) \equiv \prod_{i=1}^{a} \prod_{s=1}^{L_{i}^{+}(\mathbf{d})}\left(\sum_{r=1}^{k} \ell_{r i}^{+} \mathrm{A}_{r}+s \hbar\right) \prod_{i=1}^{b} \prod_{s=0}^{-L_{i}^{-}(\mathbf{d})-1}\left(\sum_{r=1}^{k} \ell_{r i}^{-} \mathrm{A}_{r}-s \hbar\right) \in \mathbb{Z}[A, \hbar]  \tag{3.6}\\
& \ddot{E}(\mathbf{d} ; A, \hbar) \equiv \prod_{i=1}^{a} \prod_{s=0}^{L_{i}^{+}(\mathbf{d})-1}\left(\sum_{r=1}^{k} \ell_{r i}^{+} \mathrm{A}_{r}+s \hbar\right) \prod_{i=1}^{b} \prod_{s=1}^{-L_{i}^{-}(\mathbf{d})}\left(\sum_{r=1}^{k} \ell_{r i}^{-} \mathrm{A}_{r}-s \hbar\right) \in \mathbb{Z}[A, \hbar] .
\end{align*}
$$

The formal power series computing $\dot{Z}_{\mathbf{p}}$ and $\ddot{Z}_{\mathbf{p}}$ in Theorem 3.5 are obtained from

$$
\begin{align*}
& \dot{Y}(\mathrm{~A}, \hbar, q) \equiv \sum_{\mathbf{d} \in \Lambda} q^{\mathbf{d}} U(\mathbf{d} ; \mathrm{A}, \hbar) \dot{E}(\mathbf{d} ; \mathrm{A}, \hbar) \in \mathbb{Q}[A]\left[\left[\hbar^{-1}, \Lambda\right]\right]  \tag{3.7}\\
& \ddot{Y}(\mathrm{~A}, \hbar, q) \equiv \sum_{\mathbf{d} \in \Lambda} q^{\mathrm{d}} U(\mathbf{d} ; \mathrm{A}, \hbar) \ddot{E}(\mathbf{d} ; \mathrm{A}, \hbar) \in \mathbb{Q}[A]\left[\left[\hbar^{-1}, \Lambda\right]\right] .
\end{align*}
$$

We define

$$
\begin{equation*}
\dot{I}_{\mathbf{0}}(q) \equiv \dot{Y}(\mathrm{~A}, \hbar, q) \quad \bmod \hbar^{-1}, \quad \dddot{I}_{\mathbf{0}}(q) \equiv \ddot{Y}(\mathrm{~A}, \hbar, q) \quad \bmod \hbar^{-1} \tag{3.8}
\end{equation*}
$$

and so

$$
\begin{aligned}
& \dot{I}_{\mathbf{0}}(q) \equiv 1+\delta_{b, 0} \sum_{\begin{array}{c}
\mathbf{d} \in \Lambda-0, \nu_{E}(\mathbf{d})=0 \\
D_{j}(\mathbf{d}) \geqslant 0 \forall j \in[N]
\end{array}} q^{\mathbf{d}} \frac{\prod_{j=1}^{a}\left(L_{i}^{+}(\mathbf{d})!\right)}{\prod_{j=1}^{N}\left(D_{j}(\mathbf{d})!\right)}, \\
& \dddot{I}_{\mathbf{0}}(q) \equiv 1+\sum_{\substack{\mathbf{d} \in \Lambda-0, \nu_{E}(\mathbf{d})=0 \\
D_{j}(\mathbf{d} \geqslant 0 \forall j \in N] \\
L_{i}^{+}(\mathbf{d})=0 \forall i \in[a]}} q^{\mathbf{d}}(-1)^{\sum_{i=1}^{b} L_{i}^{-}(\mathbf{d})} \frac{\prod_{i=1}^{b}\left(\left(-L_{i}^{-}(\mathbf{d})\right)!\right)}{\prod_{j=1}^{N}\left(D_{j}(\mathbf{d})!\right)} .
\end{aligned}
$$

We next describe an operator $\mathbf{D}^{\mathbf{p}}$ acting on a subset of $\mathbb{Q}(\mathrm{A}, \hbar)[[\Lambda]]$ and certain associated "structure coefficients" in $\mathbb{Q}[[\Lambda]]$ which occur in the formulas for $\dot{Z}_{\mathbf{p}}$ and $\dddot{Z}_{\mathbf{p}}$. Fix an element $Y(\mathrm{~A}, \hbar, q)$ of $\mathbb{Q}(\mathrm{A}, \hbar)[[\Lambda]]$ such that for all $\mathbf{d} \in \Lambda$

$$
\llbracket Y(\mathrm{~A}, \hbar, q) \rrbracket_{q ; \mathrm{d}} \equiv \frac{f_{\mathbf{d}}(\mathrm{A}, \hbar)}{g_{\mathbf{d}}(\mathrm{A}, \hbar)}
$$

for some homogeneous polynomials $f_{\mathbf{d}}(\mathrm{A}, \hbar), g_{\mathbf{d}}(\mathrm{A}, \hbar) \in \mathbb{Q}[\mathrm{A}, \hbar]$ satisfying

$$
\begin{equation*}
f_{\mathbf{0}}(\mathrm{A}, \hbar)=g_{\mathbf{0}}(\mathrm{A}, \hbar), \quad \operatorname{deg} f_{\mathbf{d}}-\operatorname{deg} g_{\mathbf{d}}=-\nu_{E}(\mathbf{d}),\left.\quad g_{\mathbf{d}}\right|_{\mathrm{A}=0} \neq 0 \quad \forall \mathbf{d} \in \Lambda \tag{3.9}
\end{equation*}
$$

This condition is satisfied by the power series $\dot{Y}$ and $\ddot{Y}$ of (3.7) and so the construction below applies to $Y=\dot{Y}$ and $Y=\ddot{Y}$. We inductively define
$J_{p}(Y) \in \operatorname{End}_{\mathbb{Q}\left[\left[\Lambda ; \nu_{E}=0\right]\right]}\left(\mathbb{Q}\left[\left[\Lambda ; \nu_{E}=0\right]\right][\mathrm{A}]_{p}\right) \forall p \in \mathbb{Z}^{\geqslant 0}, \quad \mathbf{D}^{\mathrm{p}} Y(\mathrm{~A}, \hbar, q) \in \mathbb{Q}(\mathrm{A}, \hbar)[[\Lambda]] \forall \mathbf{p} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k}$ satisfying
(P1) for every $\mathbf{p} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k}$ with $|\mathbf{p}|=p, \llbracket\left\{J_{p}(Y)\right\}\left(\mathrm{A}^{\mathbf{p}}\right) \rrbracket_{q ; \mathbf{0}}=\mathrm{A}^{\mathbf{p}}$;
(P2) there exist $\mathrm{C}_{\mathbf{p}, s}^{(\mathbf{r})} \equiv \mathrm{C}_{\mathbf{p}, s}^{(\mathbf{r})}(Y) \in \mathbb{Q}[[\Lambda]]$ with $\mathbf{p}, \mathbf{r} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k}$ and $s \in \mathbb{Z}^{\geqslant 0}$ such that

$$
\begin{gather*}
\mathbf{D}^{\mathbf{p}} Y(\mathrm{~A}, \hbar, q)=\hbar^{|\mathbf{p}|} \sum_{s=0}^{\infty} \sum_{\mathbf{r} \in(\mathbb{Z} \geq 0)^{k}} \mathrm{C}_{\mathbf{p}, s}^{(\mathbf{r})}(q) \mathrm{A}^{\mathbf{r}} \hbar^{-s},  \tag{3.10}\\
\llbracket \mathrm{C}_{\mathbf{p}, s}^{(\mathbf{r})} \rrbracket_{q ; \mathbf{d}}=0 \text { if } s \neq \nu_{E}(\mathbf{d})+|\mathbf{r}|, \llbracket \mathrm{C}_{\mathbf{p}, s}^{(\mathbf{r})} \rrbracket_{\nu_{E}=0}=\delta_{\mathbf{p}, \mathbf{r}} \delta_{|\mathbf{r}|, s} \text { if } s \leqslant|\mathbf{p}|, \quad \llbracket \mathrm{C}_{\mathbf{p}, \mathbf{r} \mid}^{(\mathbf{r})} \rrbracket_{q ; 0}=\delta_{\mathbf{p}, \mathbf{r}} . \tag{3.11}
\end{gather*}
$$

By (3.9), we can define $J_{0}(Y) \in \mathbb{Q}\left[\left[\Lambda ; \nu_{E}=0\right]\right]$ and $\mathbf{D}^{0} Y \in \mathbb{Q}(\mathrm{~A}, \hbar)[[\Lambda]]$ by

$$
\begin{equation*}
\left\{J_{0}(Y)\right\}(1) \equiv Y(\mathrm{~A}, \hbar, q) \quad \bmod \hbar^{-1}, \quad \mathbf{D}^{0} Y(\mathrm{~A}, \hbar, q) \equiv\left[\left\{J_{0}(Y)\right\}(1)\right]^{-1} Y(\mathrm{~A}, \hbar, q) \tag{3.12}
\end{equation*}
$$

Suppose next that $p \geqslant 0$ and we have constructed an operator $J_{p}(Y)$ and power series $\mathbf{D}^{\mathbf{p}^{\prime}} Y$ for all $\mathbf{p}^{\prime} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k}$ with $\left|\mathbf{p}^{\prime}\right|=p$ satisfying the above properties. For each $\mathbf{p} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k}$ with $|\mathbf{p}|=p+1$, let

$$
\begin{align*}
\widetilde{\mathbf{D}}^{\mathbf{p}} Y(\mathrm{~A}, \hbar, q) & \equiv \frac{1}{|\operatorname{supp}(\mathbf{p})|} \sum_{i \in \operatorname{supp}(\mathbf{p})}\left\{\mathrm{A}_{i}+\hbar q_{i} \frac{\mathrm{~d}}{\mathrm{~d} q_{i}}\right\} \mathbf{D}^{\mathbf{p}-e_{i}} Y(\mathrm{~A}, \hbar, q) \in \mathbb{Q}(\mathrm{A}, \hbar)[[\Lambda]],  \tag{3.13}\\
\left\{J_{p+1}(Y)\right\}\left(\mathrm{A}^{\mathbf{p}}\right) & \equiv \llbracket \widetilde{\mathbf{D}}^{\mathbf{p}} Y(\mathrm{~A}, \hbar, q) \bmod \hbar^{-1} \rrbracket_{\mathrm{A} ; p+1},
\end{align*}
$$

where $\left\{e_{1}, \ldots, e_{k}\right\}$ is the canonical basis for $\mathbb{Z}^{k}$. $\mathrm{By}(\mathrm{P} 2)$,

$$
\begin{align*}
\left\{J_{p+1}(Y)\right\}\left(\mathrm{A}^{\mathbf{p}}\right) & =\frac{1}{|\operatorname{supp}(\mathbf{p})|} \sum_{i \in \operatorname{supp}(\mathbf{p})}\left[\sum_{|\mathbf{r}|=p} \mathrm{C}_{\mathbf{p}-e_{i}, p}^{(\mathbf{r})} \mathrm{A}_{i} \cdot \mathrm{~A}^{\mathbf{r}}+\sum_{|\mathbf{r}|=p+1} q_{i} \frac{\mathrm{dC}_{\mathbf{p}-e_{i}, p+1}^{(\mathbf{r})}}{\mathrm{d} q_{i}} \mathrm{~A}^{\mathbf{r}}\right]  \tag{3.14}\\
& =\frac{1}{|\operatorname{supp}(\mathbf{p})|} \sum_{|\mathbf{r}|=p+1}\left[\sum_{i \in \operatorname{supp}(\mathbf{p})}\left(\mathrm{C}_{\mathbf{p}-e_{i}, p}^{\left(\mathbf{r}-e_{i}\right)}+q_{i} \frac{\mathrm{dC}_{\mathbf{p}-e_{i}, p+1}^{(\mathbf{r})}}{\mathrm{d} q_{i}}\right)\right] \mathrm{A}^{\mathbf{r}},
\end{align*}
$$

where we set $\mathrm{C}_{\mathbf{p}-e_{i}, p}^{\left(\mathbf{r}-e_{i}\right)} \equiv 0$ if $i \notin \operatorname{supp}(\mathbf{r})$. By (3.14) and (3.11),

$$
\begin{equation*}
\left\{J_{p+1}(Y)\right\}\left(\mathrm{A}^{\mathbf{p}}\right) \in \mathbb{Q}\left[\left[\Lambda ; \nu_{E}=0\right]\right][\mathrm{A}]_{p+1} \quad \text { and } \quad \llbracket\left\{J_{p+1}(Y)\right\}\left(\mathrm{A}^{\mathbf{p}}\right) \rrbracket_{q ; \mathbf{0}}=\mathrm{A}^{\mathbf{p}} \tag{3.15}
\end{equation*}
$$

in particular, $J_{p+1}(Y)$ is invertible. With $\mathrm{c}_{\mathbf{p} ; \mathbf{p}^{\prime}}(q) \in \mathbb{Q}\left[\left[\Lambda ; \nu_{E}=0\right]\right]$ for $\mathbf{p}, \mathbf{p}^{\prime} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k}$ with $\left|\mathbf{p},,\left|\mathbf{p}^{\prime}\right|=p+1\right.$ given by

$$
\begin{equation*}
\left\{J_{p+1}(Y)\right\}^{-1}\left(\mathrm{~A}^{\mathbf{p}}\right) \equiv \sum_{\mathbf{p}^{\prime} \in(\mathbb{Z} \geq 0)^{k},\left|\mathbf{p}^{\prime}\right|=p+1} \mathrm{c}_{\mathbf{p} ; \mathbf{p}^{\prime}}(q) \mathrm{A}^{\mathbf{p}^{\prime}} \tag{3.16}
\end{equation*}
$$

we define

$$
\begin{equation*}
\mathbf{D}^{\mathbf{p}} Y(\mathrm{~A}, \hbar, q) \equiv \sum_{\mathbf{p}^{\prime} \in(\mathbb{Z} \geq 0)^{k},\left|\mathbf{p}^{\prime}\right|=p+1} \mathrm{c}_{\mathbf{p} ; \mathbf{p}^{\prime}}(q) \widetilde{\mathbf{D}}^{\mathrm{p}^{\prime}} Y(\mathrm{~A}, \hbar, q) . \tag{3.17}
\end{equation*}
$$

By (3.17) and the inductive assumption (3.10),

$$
\begin{gather*}
\mathbf{D}^{\mathbf{p}} Y(\mathrm{~A}, \hbar, q)=\hbar^{p+1} \sum_{s=0}^{\infty} \sum_{\mathbf{r} \in(\mathbb{Z} \geq 0)^{k}} \mathrm{C}_{\mathbf{p}, s}^{(\mathbf{r})}(q) \mathrm{A}^{\mathbf{r}} \hbar^{-s}, \quad \text { where } \\
\mathrm{C}_{\mathbf{p}, s}^{(\mathbf{r})}=\sum_{\mathbf{p}^{\prime} \in(\mathbb{Z} \geq 0)^{k},\left|\mathbf{p}^{\prime}\right|=p+1} \frac{\mathrm{C}_{\mathbf{p} ; \mathbf{p}^{\prime}}}{\left|\operatorname{supp}\left(\mathbf{p}^{\prime}\right)\right|} \sum_{i \in \operatorname{supp}\left(\mathbf{p}^{\prime}\right)}\left(\mathrm{C}_{\mathbf{p}^{\prime}-e_{i}, s-1}^{\left(\mathbf{r}-e_{i}\right)}+q_{i} \frac{\mathrm{dC}_{\mathbf{p}^{\prime}-e_{i}, s}^{(\mathbf{r})}}{\mathrm{d} q_{i}}\right), \tag{3.18}
\end{gather*}
$$

where we set $\mathrm{C}_{\mathbf{p}^{\prime}-e_{i}, s-1}^{\left(\mathbf{r}-e_{i}\right)}=0$ if $i \notin \operatorname{supp}(\mathbf{r})$ or $s=0$. By the first property in (3.11) with $\mathbf{p}$ replaced by $\mathbf{p}^{\prime}-e_{i}$ with $\left|\mathbf{p}^{\prime}\right|=p+1$ and $i \in \operatorname{supp}\left(\mathbf{p}^{\prime}\right), \mathbf{C}_{\mathbf{p}, s}^{(\mathbf{r})}$ satisfies this property as well. By the second property in (3.11) with $\mathbf{p}$ replaced by $\mathbf{p}^{\prime}-e_{i}$ with $\left|\mathbf{p}^{\prime}\right|=p+1$ and $i \in \operatorname{supp}\left(\mathbf{p}^{\prime}\right)$, $\llbracket C_{\mathbf{p}, s}^{(\mathbf{r})} \rrbracket_{\nu_{E}=0}=0$ if $s \leqslant p$. Since $\mathrm{C}_{\mathbf{p}, p+1}^{(\mathbf{r})}=\delta_{\mathbf{p}, \mathbf{r}}$ whenever $|\mathbf{r}|=p+1$ by (3.18) and (3.16), $\mathrm{C}_{\mathbf{p}, s}^{(\mathbf{r})}$ also satisfies the second property in (3.11). By the second statement in (3.15) and (3.16), $\llbracket \mathbf{c}_{\mathbf{p}, \mathbf{p}^{\prime}} \rrbracket_{q ; \mathbf{0}}=\delta_{\mathbf{p}, \mathbf{p}^{\prime}}$. Thus, by the third property in (3.11) with $\mathbf{p}$ replaced by $\mathbf{p}^{\prime}-e_{i}$ with $\left|\mathbf{p}^{\prime}\right|=p+1$ and $i \in \operatorname{supp}\left(\mathbf{p}^{\prime}\right), \mathrm{C}_{\mathbf{p}, s}^{(\mathbf{r})}$ satisfies the last property in (3.11) as well.

Define $\widetilde{\mathrm{C}}_{\mathbf{p}, \mathbf{s}}^{(r)} \equiv \widetilde{\mathrm{C}}_{\mathbf{p}, \mathbf{s}}^{(r)}(Y) \in \mathbb{Q}[[\Lambda]]$ for $\mathbf{p}, \mathbf{s} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k}$ and $r \in \mathbb{Z}^{\geqslant 0}$ with $|\mathbf{s}| \leqslant|\mathbf{p}|-r$ and $r \leqslant|\mathbf{p}|$ by

$$
\begin{equation*}
\sum_{\substack{t=0 \\ \mathbf{s} \in(\mathbb{Z} \geqslant 0)^{k} \\|\mathbf{s}| \leqslant|\mathbf{p}|-t}} \overbrace{\mathbf{p}, \mathbf{s}}^{(t)} \mathrm{C}_{\mathbf{s},|\mathbf{r}|+r-t}^{(\mathbf{r})}=\delta_{\mathbf{p}, \mathbf{r}} \delta_{r, 0} \quad \forall \mathbf{r} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k},|\mathbf{r}| \leqslant|\mathbf{p}|-r . \tag{3.19}
\end{equation*}
$$

Equations (3.19) indeed uniquely determine $\widetilde{\mathrm{C}}_{\mathbf{p}, \mathrm{s}}^{(r)}$, since

$$
\begin{equation*}
\sum_{t=0}^{r} \sum_{\substack{\mathbf{s} \in(\mathbb{Z} \geq 0 \\|\mathbf{s}| \leqslant|\mathbf{p}|-t}} \widetilde{\mathrm{C}}_{\mathbf{p}, \mathbf{s}}^{(t)} \mathrm{C}_{\mathbf{s},|\mathbf{r}|+r-t}^{(\mathbf{r})}=\sum_{t=0}^{r-1} \sum_{\substack{\mathbf{s} \in(\mathbb{Z} \geq 0 \\|\mathbf{S}| \leqslant \mid \mathbf{p})^{k}-t}} \widetilde{\mathrm{C}}_{\mathbf{p}, \mathbf{s}}^{(t)} \mathrm{C}_{\mathbf{s},|\mathbf{r}|+r-t}^{(\mathbf{r})}+\sum_{\substack{\mathbf{s} \in(\mathbb{Z} \geq 0 \\|\mathbf{S}|<|\mathbf{r}|}} \widetilde{\mathrm{C}}_{\mathbf{p}, \mathbf{s}}^{(r)} \mathrm{C}_{\mathbf{s},|\mathbf{r}|}^{(\mathbf{r})}+\widetilde{\mathrm{C}}_{\mathbf{p}, \mathbf{r}}^{(r)}, \tag{3.20}
\end{equation*}
$$

as follows from (3.11). By (3.19) together with the first and third statements in (3.11),

$$
\begin{equation*}
\llbracket \widetilde{\mathrm{C}}_{\mathbf{p}, \mathrm{s}}^{(r)} \rrbracket_{q ; \mathbf{0}}=\delta_{\mathbf{p}, \mathrm{s}} \delta_{r, 0} \tag{3.21}
\end{equation*}
$$

By (3.19), (3.20), and induction on $|\mathbf{s}|$,

$$
\begin{equation*}
\widetilde{\mathrm{C}}_{\mathbf{p}, \mathbf{s}}^{(0)}(q)=\delta_{\mathbf{p}, \mathbf{s}} \quad \forall \mathbf{p}, \mathbf{s} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k} \quad \text { with } \quad|\mathbf{s}| \leqslant|\mathbf{p}| . \tag{3.22}
\end{equation*}
$$

By (3.19), (3.20), the first statement in (3.11), and induction on $|\mathbf{s}|$ and $r$,

$$
\begin{equation*}
\llbracket \widetilde{\mathrm{C}}_{\mathbf{p}, \mathbf{s}}^{(r)} \rrbracket_{q ; \mathbf{d}}=0 \quad \text { if } \quad \nu_{E}(\mathbf{d}) \neq r . \tag{3.23}
\end{equation*}
$$

Remark 3.1. With $\dot{Y}, \ddot{Y}$ as in (3.7) and $\dot{I}_{\mathbf{0}}, \dddot{I}_{0}$ as in (3.8),

$$
\begin{array}{ll}
\left\{J_{0}(\dot{Y})\right\}(1)=\dot{I}_{0}(q), & \mathbf{D}^{0} \dot{Y}(\mathrm{~A}, \hbar, q)=\frac{1}{\dot{I}_{0}(q)} \dot{Y}(\mathrm{~A}, \hbar, q), \\
\left\{J_{0}(\ddot{Y})\right\}(1)=\ddot{I}_{\mathbf{0}}(q), & \mathbf{D}^{0} \ddot{Y}(\mathrm{~A}, \hbar, q)=\frac{1}{\ddot{I}_{0}(q)} \dot{Y}(\mathrm{~A}, \hbar, q),
\end{array}
$$

by (3.12).
Define

$$
\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathrm{p}} \equiv\left\{\mathrm{~A}_{1}+\hbar q_{1} \frac{\mathrm{~d}}{\mathrm{~d} q_{1}}\right\}^{p_{1}} \ldots\left\{\mathrm{~A}_{k}+\hbar q_{k} \frac{\mathrm{~d}}{\mathrm{~d} q_{k}}\right\}^{p_{k}} \quad \forall \mathbf{p}=\left(p_{1}, \ldots, p_{k}\right) \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k}
$$

Remark 3.2. If $\nu_{E}(\mathbf{d})>0$ for all $\mathbf{d} \in \Lambda-\{0\}$ and $Y(\mathrm{~A}, \hbar, q) \in \mathbb{Q}(\mathrm{A}, \hbar)[[\Lambda]]$ satisfies (3.9), then $J_{p}(Y)=\mathrm{Id}$ for all $p \in \mathbb{Z}^{\geqslant 0}$ by (P1) above. Along with the first equation in (3.13), (3.16), (3.17), and induction on $|\mathbf{p}|$, this implies that

$$
\mathbf{D}^{\mathbf{p}} Y(\mathrm{~A}, \hbar, q)=\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathbf{p}} Y(\mathrm{~A}, \hbar, q)
$$

for all $\mathbf{p} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k}$.
Remark 3.3. Suppose $p^{*} \in \mathbb{Z}^{\geqslant 0}, Y(\mathrm{~A}, \hbar, q) \in \mathbb{Q}(\mathrm{A}, \hbar)[[\Lambda]]$ satisfies (3.9), and

$$
\operatorname{deg}_{\hbar} f_{\mathbf{d}}(\mathrm{A}, \hbar)-\operatorname{deg}_{\hbar} g_{\mathbf{d}}(\mathrm{A}, \hbar)<-p^{*} \quad \forall \mathbf{d} \in \Lambda-\{0\} .
$$

By the same reasoning as in Remark 3.2, we again find that

$$
J_{p}(Y)=\mathrm{Id}, \quad \mathbf{D}^{\mathrm{p}} Y(\mathrm{~A}, \hbar, q) \equiv\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathrm{p}} Y(\mathrm{~A}, \hbar, q)
$$

for all $p \in \mathbb{Z}^{\geqslant 0}$ and $\mathbf{p} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k}$ such that $p,|\mathbf{p}| \leqslant p^{*}$.

Remark 3.4. Let $(M, \tau)$ be the toric pair of Example 2.22 with $N=n$ so that $X_{M}^{\tau}=\mathbb{P}^{n-1}$. Let

$$
E \equiv \bigoplus_{i=1}^{a} \mathcal{O}_{\mathbb{P}^{n-1}}\left(\ell_{i}^{+}\right) \oplus \bigoplus_{i=1}^{b} \mathcal{O}_{\mathbb{P}^{n-1}}\left(\ell_{i}^{-}\right)
$$

with $a, b \geqslant 0, \ell_{i}^{+}>0$ for all $i \in[a], \ell_{i}^{-}<0$ for all $i \in[b]$, and $\sum_{i=1}^{a} \ell_{i}^{+}-\sum_{i=1}^{b} \ell_{i}^{-} \leqslant n$. Thus,

$$
\nu_{E}(d)=\left(n-\sum_{i=1}^{a} \ell_{i}^{+}+\sum_{i=1}^{b} \ell_{i}^{-}\right) d
$$

for all $d \in \mathbb{Z}^{\geqslant 0}$. By (3.7),

$$
\begin{aligned}
& \dot{Y}(\mathrm{~A}, \hbar, q)=\sum_{d=0}^{\infty} q^{d} \frac{\prod_{i=1}^{a} \prod_{s=1}^{\ell_{i}^{+} d}\left(\ell_{i}^{+} \mathrm{A}+s \hbar\right) \prod_{i=1}^{b} \prod_{s=0}^{-\ell_{i}^{-} d-1}\left(\ell_{i}^{-} \mathrm{A}-s \hbar\right)}{\prod_{s=1}^{d}(\mathrm{~A}+s \hbar)^{n}} \\
& \ddot{Y}(\mathrm{~A}, \hbar, q)=\sum_{d=0}^{\infty} q^{d} \frac{\prod_{i=1}^{a} \prod_{s=0}^{\ell_{i}^{+}} \prod_{-1}\left(\ell_{i}^{+} \mathrm{A}+s \hbar\right) \prod_{i=1}^{b} \prod_{s=1}^{-\ell_{i}^{-} d}\left(\ell_{i}^{-} \mathrm{A}-s \hbar\right)}{\prod_{s=1}^{d}(\mathrm{~A}+s \hbar)^{n}}
\end{aligned}
$$

By Remark 3.3,

$$
\begin{aligned}
& J_{p}(\dot{Y})=\mathrm{Id}, \quad \mathrm{D}^{p} \dot{Y}(\mathrm{~A}, \hbar, q)=\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{p} \dot{Y}(\mathrm{~A}, \hbar, q) \quad \forall p<b, \\
& J_{p}(\ddot{Y})=\mathrm{Id}, \quad \mathbf{D}^{p} \ddot{Y}(\mathrm{~A}, \hbar, q)=\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{p} \ddot{Y}(\mathrm{~A}, \hbar, q) \quad \forall p<a .
\end{aligned}
$$

If $\sum_{i=1}^{a} \ell_{i}^{+}-\sum_{i=1}^{b} \ell_{i}^{-}<n$, then

$$
J_{p}(\dot{Y}), J_{p}(\ddot{Y})=\mathrm{Id}, \quad \mathbf{D}^{p} \dot{Y}=\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{p} \dot{Y}, \quad \mathbf{D}^{p} \ddot{Y}=\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{p} \ddot{Y}
$$

for all $p$ by Remark 3.2. If $\sum_{i=1}^{a} \ell_{i}^{+}-\sum_{i=1}^{b} \ell_{i}^{-}=n$, then we follow PoZ, (1.1)] and set

$$
\begin{gather*}
F(\mathrm{w}, q) \equiv \sum_{d=0}^{\infty} q^{d} \frac{\prod_{i=1}^{a} \prod_{r=1}^{\ell_{i}^{+} d}\left(\ell_{i}^{+} \mathrm{w}+r\right) \prod_{i=1}^{b} \prod_{r=1}^{-\ell_{i}^{-} d}\left(\ell_{i}^{-} \mathrm{w}-r\right)}{\prod_{r=1}^{d}(\mathrm{w}+r)^{n}},  \tag{3.24}\\
\mathbf{M} F(\mathrm{w}, q) \equiv\left\{1+\frac{q}{\mathrm{w}} \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}\left(\frac{F(\mathrm{w}, q)}{F(0, q)}\right), \quad I_{p}(q) \equiv \mathbf{M}^{p} F(0, q) .
\end{gather*}
$$

By (3.13) and (3.17) above,

$$
\begin{array}{lll}
J_{p}(\dot{Y})=I_{p-b}(q) \mathrm{Id}, & \mathbf{D}^{p} \dot{Y}(\mathrm{~A}, \hbar, q)=\mathrm{A}^{p} \frac{1}{I_{p-b}(q)} \mathbf{M}^{p-b} F\left(\frac{\mathrm{~A}}{\hbar}, q\right) & \forall p \geqslant b, \\
J_{p}(\ddot{Y})=I_{p-a}(q) \mathrm{Id}, & \mathbf{D}^{p} \ddot{Y}(\mathrm{~A}, \hbar, q)=\mathrm{A}^{p} \frac{1}{I_{p-a}(q)} \mathbf{M}^{p-a} F\left(\frac{\mathrm{~A}}{\hbar}, q\right) & \forall p \geqslant a .
\end{array}
$$

### 3.2 Statements

The statements and proofs of the theorems below rely on the one-point mirror formula (5.2) below, which is proved in [LLY3]. We begin by defining the mirror map occurring in this formula.

For each $i \in[k]$, let

$$
\begin{equation*}
\left.f_{i}(q) \equiv \frac{1}{\dot{I}_{\mathbf{0}}(q)} \sum_{\substack{\mathbf{d} \in \Lambda \\ \nu_{E}(\mathbf{d})=0}} q^{\mathrm{d}} \frac{\partial\{U(\mathbf{d} ; \mathrm{A}, 1) \dot{E}(\mathbf{d} ; \mathrm{A}, 1)\}}{\partial \mathrm{A}_{i}}\right|_{\mathrm{A}=0} \in \mathbb{Q}[[\Lambda-0]], \tag{3.25}
\end{equation*}
$$

with $\dot{I}_{0}(q)$ defined by (3.8). The mirror map is the change of variables $q \longrightarrow Q$, where

$$
\begin{equation*}
\left(Q_{1}, \ldots, Q_{k}\right)=\left(q_{1} \mathrm{e}^{f_{1}(q)}, \ldots, q_{k} \mathrm{e}^{f_{k}(q)}\right) . \tag{3.26}
\end{equation*}
$$

Finally, let

Theorem 3.5. If $\nu_{E}(\mathbf{d}) \geqslant 0$ for all $\mathbf{d} \in \Lambda$, then $\dot{Z}_{\mathbf{p}}$ and $\ddot{Z}_{\mathbf{p}}$ of (3.1) and (1.9) are given by

$$
\begin{aligned}
& \dot{Z}_{\mathbf{p}}(\hbar, Q)=\mathrm{e}^{-\frac{1}{\hbar}\left[G(q)+\sum_{i=1}^{k} \mathrm{H}_{i} f_{i}(q)\right]} \dot{Y}_{\mathbf{p}}(\mathrm{H}, \hbar, q) \in H^{*}\left(X_{M}^{\tau}\right)\left[\hbar^{-1}\right][[\Lambda]], \\
& \ddot{Z}_{\mathbf{p}}(\hbar, Q)=\mathrm{e}^{-\frac{1}{\hbar}\left[G(q)+\sum_{i=1}^{k} \mathrm{H}_{i} f_{i}(q)\right]} \ddot{Y}_{\mathbf{p}}(\mathrm{H}, \hbar, q) \in H^{*}\left(X_{M}^{\tau}\right)\left[\hbar^{-1}\right][[\Lambda]],
\end{aligned}
$$

where

$$
\begin{align*}
& \dot{Y}_{\mathbf{p}}(\mathrm{A}, \hbar, q) \equiv \mathbf{D}^{\mathbf{p}} \dot{Y}(\mathrm{~A}, \hbar, q)+\sum_{r=1}^{|\mathbf{p}|} \sum_{|\mathbf{s}|=0}^{|\mathbf{p}|-r} \dot{\widetilde{C}}_{\mathbf{p}, \mathbf{s}}^{(r)}(q) \hbar^{|\mathbf{p}|-r-|\mathbf{s}|} \mathbf{D}^{\mathbf{s}} \dot{Y}(\mathrm{~A}, \hbar, q) \in \mathbb{Q}(\mathrm{A}, \hbar)[[\Lambda]],  \tag{3.28}\\
& \ddot{Y}_{\mathbf{p}}(\mathrm{A}, \hbar, q) \equiv \mathbf{D}^{\mathbf{p}} \ddot{Y}(\mathrm{~A}, \hbar, q)+\sum_{r=1}^{|\mathbf{p}|} \sum_{|\mathbf{s}|=0}^{|\mathbf{p}|-r} \ddot{\widetilde{C}}_{\mathbf{p}, \mathbf{s}}^{(r)}(q) \hbar^{|\mathbf{p}|-r-|\mathbf{s}|} \mathbf{D}^{\mathrm{s}} \ddot{Y}(\mathrm{~A}, \hbar, q) \in \mathbb{Q}(\mathrm{A}, \hbar)[[\Lambda]],
\end{align*}
$$

with $\dot{\widetilde{\mathrm{C}}}_{\mathbf{p}, \mathbf{s}}^{(r)} \equiv \widetilde{\mathrm{C}}_{\mathbf{p}, \mathbf{s}}^{(r)}(\dot{Y})$ and $\ddot{\mathrm{C}}_{\mathbf{p}, \mathbf{s}}^{(r)} \equiv \widetilde{\mathrm{C}}_{\mathbf{p}, \mathbf{s}}^{(r)}(\ddot{Y})$ defined by (3.19), $Q$ and $q$ related by the mirror map (3.26), $G$ and $f_{i}$ given by (3.27) and (3.25), and the operator $\mathbf{D}^{\mathbf{p}}$ defined by (3.13) and (3.17).

If $|\mathbf{p}|<b, \mathbf{D}^{\mathrm{p}} \dot{Y}=\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathrm{p}} \dot{Y}$ and $\dot{\widetilde{\mathrm{C}}}_{\mathbf{p}, \mathrm{s}}^{(r)}=0$ for all $r \in[|\mathbf{p}|]$. If $|\mathbf{p}|<a$ and $L_{i}^{+}(\mathbf{d}) \geqslant 1$ for all $i \in[a]$ and $\mathbf{d} \in \Lambda-\{0\}$, then $\mathbf{D}^{\mathbf{p}} \ddot{Y}=\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathbf{p}} \ddot{Y}$ and $\ddot{\widetilde{\mathrm{C}}}_{\mathbf{p}, \mathbf{s}}^{(r)}=0$ for all $r \in[|\mathbf{p}|]$.

This follows from Theorem 4.7 together with (4.18) and (EP1) below; Theorem 4.7 is an equivariant version of Theorem 3.5.

Remark 3.6. In the inductive construction of $\mathbf{D}^{\mathbf{p}} Y$ with $Y=\dot{Y}$ or $Y=\ddot{Y}$, the first equation in (3.13) may be replaced by

$$
\widetilde{\mathbf{D}}^{\mathbf{p}} Y(\mathrm{~A}, \hbar, q) \equiv \sum_{i \in \operatorname{supp}(\mathbf{p})} c_{\mathbf{p} ; i}\left\{\mathrm{~A}_{i}+\hbar q_{i} \frac{\mathrm{~d}}{\mathrm{~d} q_{i}}\right\} \mathbf{D}^{\mathbf{p}-e_{i}} Y(\mathrm{~A}, \hbar, q) \in \mathbb{Q}(\mathrm{A}, \hbar)[[\Lambda]]
$$

for any tuple $\left(c_{\mathbf{p} ; i}\right)_{i \in \operatorname{supp}(\mathbf{p})}$ of rational numbers with $\sum_{i \in \operatorname{supp}(\mathbf{p})} c_{\mathbf{p} ; i}=1$. The endomorphism $J_{p+1}(Y)$ and the power series $\mathbf{D}^{\mathrm{p}} Y$ defined by the second equation in (3.13) and (3.17) in terms of the new "weighted" $\widetilde{\mathbf{D}}^{\mathbf{P}} Y$ satisfy (P1) and (P2) by the same arguments as in the case when $c_{\mathbf{p} ; i}=\frac{1}{|\operatorname{supp}(\mathbf{p})|}$ for all $i \in \operatorname{supp}(\mathbf{p})$. Therefore, (3.19) continues to define power series $\widetilde{\mathrm{C}}_{\mathbf{p}, \mathbf{s}}^{(r)}(Y)$ in terms of the "new weighted" $\mathrm{C}_{\mathbf{p}, \mathbf{s}}^{(\mathbf{r})}(Y)$. The resulting "weighted" power series $Y_{\mathbf{p}}$ of (3.28) do not depend on the "weights" $c_{\mathbf{p} ; i}$ as elements of $\left.H^{*}\left(X_{M}^{\tau}\right) \Pi \hbar\right\rceil[[\Lambda]]$; this follows from Remark 4.10.

Corollary 3.7. If $\nu_{E}(\mathbf{d})=0$ or $\nu_{E}(\mathbf{d})>|\mathbf{p}|$ for all $\mathbf{d} \in \Lambda-\{0\}$, then

$$
\left.\left.\dot{Z}_{\mathbf{p}}(\hbar, Q)=\mathrm{e}^{-\frac{1}{\hbar}\left[G(q)+\sum_{i=1}^{k} \mathrm{H}_{i} f_{i}(q)\right.}\right] \mathbf{D}^{\mathrm{p}} \dot{Y}(\mathrm{H}, \hbar, q), \quad \ddot{Z}_{\mathbf{p}}(\hbar, Q)=\mathrm{e}^{-\frac{1}{\hbar}\left[G(q)+\sum_{i=1}^{k} H_{i} f_{i}(q)\right.}\right] \mathbf{D}^{\mathrm{p}} \ddot{Y}(\mathrm{H}, \hbar, q),
$$

with $Q$ and $q$ related by the mirror map (3.26) and $G$ and $f_{i}$ given by (3.27) and (3.25).
This follows from Theorem 3.5 together with (3.23).
Let $\mathrm{pr}_{i}: X_{M}^{\tau} \times X_{M}^{\tau} \longrightarrow X_{M}^{\tau}$ denote the projection onto the $i$-th component.
Corollary 3.8. Let $g_{\mathrm{ps}} \in \mathbb{Q}$ be such that $\sum_{|\mathbf{p}|+|\mathbf{s}|=N-k} g_{\mathrm{ps}} \mathrm{pr}_{1}^{*} \mathrm{H}^{\mathbf{p}} \mathrm{pr}_{2}^{*} \mathrm{H}^{\mathbf{s}}$ is the Poincaré dual to the diagonal class in $X_{M}^{\tau}$, where $N-k$ is the complex dimension of $X_{M}^{\tau}$. If $N>k$ and $\nu_{E}(\mathbf{d})>N-k$ for all $\mathbf{d} \in \Lambda-\{0\}$, then the two-point function $\dot{Z}$ of (1.8) is given by $\dot{Z}\left(\hbar_{1}, \hbar_{2}, q\right)=\frac{1}{\hbar_{1}+\hbar_{2}} \sum_{|\mathbf{p}|+|\mathbf{s}|=N-k} g_{\mathbf{p s}} \operatorname{pr}_{1}^{*}\left\{\mathrm{H}+\hbar_{1} q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathrm{p}} \dot{Y}\left(\mathrm{H}, \hbar_{1}, q\right) \operatorname{pr}_{2}^{*}\left\{\mathrm{H}+\hbar_{2} q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathrm{s}} \ddot{Y}\left(\mathrm{H}, \hbar_{2}, q\right)$.

This follows from Theorem 1.3, Corollary 3.7, and Remark 3.2,
Remark 3.9. If

$$
P(\mathrm{~A}) \equiv \frac{\prod_{i=1}^{a}\left(\sum_{r=1}^{k} \ell_{r i}^{+} \mathrm{A}_{r}\right)}{\prod_{i=1}^{b}\left(\sum_{r=1}^{k} \ell_{r i}^{-} \mathrm{A}_{r}\right)} \in \mathbb{Q}[\mathrm{A}],
$$

then

$$
Z^{*}\left(\hbar_{1}, \hbar_{2}, Q\right)=\dot{Z}^{*}\left(\hbar_{1}, \hbar_{2}, Q\right) \operatorname{pr}_{1}^{*} P(\mathrm{H}),
$$

where $\operatorname{pr}_{1}: X_{M}^{\tau} \times X_{M}^{\tau} \longrightarrow X_{M}^{\tau}$ is the projection onto the first component, while $\dot{Z}^{*}$ and $Z^{*}$ are as in Remark [1.4. Via Theorem 1.3, this expresses the two-point function $Z^{*}$ in terms of the one-point functions $\check{Z}_{\eta}, \dddot{Z}_{\eta}$. In this case and if $\nu_{E}(\mathbf{d}) \geqslant 0$ for all $\mathbf{d} \in \Lambda, Z^{*}$ can be computed explicitly in terms of $\dot{Y}$ and $\ddot{Y}$ via Theorem 3.5,

We next use an idea from [CoZ] to express $Z^{*}$ in terms of one-point GW generating functions and then show how to compute the latter in the $b>0$ case. If $\mathrm{pr}_{i}: X_{M}^{\tau} \times X_{M}^{\tau} \longrightarrow X_{M}^{\tau}$ and $g_{\mathrm{ps}} \in \mathbb{Q}$ are as in Corollary 3.8, then

$$
\begin{align*}
Z^{*}\left(\hbar_{1}, \hbar_{2}, Q\right)=\frac{1}{\hbar_{1}+\hbar_{2}} \sum_{|\mathbf{p}|+|\mathbf{s}|=N-k} g_{\mathbf{p s}} & {\left[\operatorname{pr}_{1}^{*} \mathrm{H}^{\mathbf{p}} \operatorname{pr}_{2}^{*} Z_{\mathbf{s}}^{*}\left(\hbar_{2}, Q\right)\right.}  \tag{3.29}\\
+ & \left.\operatorname{pr}_{1}^{*} Z_{\mathbf{p}}^{*}\left(\hbar_{1}, Q\right) \operatorname{pr}_{2}^{*} \ddot{Z}_{\mathbf{s}}\left(\hbar_{2}, Q\right)\right]
\end{align*}
$$

where

$$
Z_{\mathbf{p}}^{*}(\hbar, Q) \equiv \sum_{\mathbf{d} \in \Lambda-0} Q^{\mathbf{d}} \mathrm{ev}_{1 *}\left[\frac{\mathbf{e}\left(\mathcal{V}_{E}\right) \mathrm{ev}_{2}^{*} \mathrm{H}^{\mathbf{p}}}{\hbar-\psi_{1}}\right] \in H^{*}\left(X_{M}^{\tau}\right)\left[\hbar^{-1}\right][[\Lambda]]
$$

and $\mathrm{ev}_{1}: \overline{\mathfrak{M}}_{0,2}\left(X_{M}^{\tau}, \mathbf{d}\right) \longrightarrow X_{M}^{\tau}$. This follows from (4.27).
We next assume that $b>0$ and $\nu_{E}(\mathbf{d}) \geqslant 0$ for all $\mathbf{d} \in \Lambda$ and $\operatorname{express} Z_{\mathbf{p}}^{*}(\hbar, Q)$ in terms of explicit power series. Along with (3.29) and Theorem 3.5, this will conclude the computation of $Z^{*}$.

With $U(\mathbf{d} ; \mathrm{A}, \hbar)$ given by (3.4), we define

$$
\begin{equation*}
\widehat{Y}(\mathrm{~A}, \hbar, q) \equiv \sum_{\mathbf{d} \in \Lambda} q^{\mathbf{d}} U(\mathbf{d} ; \mathrm{A}, \hbar) \prod_{i=1}^{a} \prod_{s=1}^{L_{i}^{+}(\mathbf{d})}\left(\sum_{r=1}^{k} \ell_{r i}^{+} \mathrm{A}_{r}+s \hbar\right) \prod_{i=1}^{b} \prod_{s=1}^{-L_{i}^{-}(\mathbf{d})}\left(\sum_{r=1}^{k} \ell_{r i}^{-} \mathrm{A}_{r}-s \hbar\right) . \tag{3.30}
\end{equation*}
$$

As $\hat{Y}$ satisfies (3.9), we may define $\mathbf{D}^{\mathbf{p}} \hat{Y}$ and $\widetilde{\mathrm{C}}_{\mathbf{p}, \mathbf{s}}^{(r)} \equiv \widetilde{\mathrm{C}}_{\mathbf{p}, \mathbf{s}}^{(r)}(\hat{Y})$ by (3.17) and (3.19). We define $\widehat{Y}_{\mathbf{p}}(\mathrm{A}, \hbar, q)$ by the right-hand side of (3.28) above, with $\dot{Y}$ replaced by $\hat{Y}$ and $\dot{\widetilde{\mathrm{C}}}_{\mathbf{p}, \mathbf{s}}^{(r)}$ by $\widetilde{\mathrm{C}}_{\mathbf{p}, \mathbf{s}}^{(r)}$. Let

$$
\begin{equation*}
\tilde{Y}^{*}(\mathrm{~A}, \hbar, q) \equiv \sum_{\mathbf{d} \in \Lambda-0} q^{\mathbf{d}} U(\mathbf{d} ; \mathrm{A}, \hbar) \prod_{i=1}^{a} \prod_{s=1}^{L_{i}^{+}(\mathbf{d})}\left(\sum_{r=1}^{k} \ell_{r i}^{+} \mathrm{A}_{r}+s \hbar\right) \prod_{i=1}^{b} \prod_{s=1}^{-L_{i}^{-}(\mathbf{d})-1}\left(\sum_{r=1}^{k} \ell_{r i}^{-} \mathrm{A}_{r}-s \hbar\right) \tag{3.31}
\end{equation*}
$$

We define $\mathrm{E}_{\mathbf{p}, \mathbf{s}}^{(\mathbf{r})} \in \mathbb{Q}[[\Lambda]]$ by

$$
\begin{equation*}
\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathrm{p}} \tilde{Y}^{*}(\mathrm{~A}, \hbar, q) \cong \sum_{s=0}^{|\mathbf{p}|-b|\mathbf{p}|-b-s} \sum_{|\mathbf{r}|=0}^{(\mathbf{r})} \mathrm{E}_{\mathbf{p}, s} \mathrm{~A}^{\mathrm{r}} \hbar^{s} \quad \bmod \hbar^{-1} . \tag{3.32}
\end{equation*}
$$

It follows that $\llbracket \mathrm{E}_{\mathbf{p}, \mathbf{s}}^{(\mathbf{r})} \rrbracket_{q ; \mathbf{d}}=0$ unless $|\mathbf{p}|=b+s+\nu_{E}(\mathbf{d})+|\mathbf{r}|$. Whenever $b \geqslant 2$,

$$
\begin{equation*}
Z_{\mathbf{p}}^{*}(\hbar, q)=e\left(E^{+}\right)\left[\left\{\mathrm{H}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathbf{p}} \tilde{Y}^{*}(\mathrm{H}, \hbar, q)-\sum_{s=0}^{|\mathbf{p}|-b|\mathbf{p}|-b-s} \sum_{|\mathbf{r}|=0}^{(\mathbf{r})} \mathrm{E}_{\mathbf{p}, s}^{s} \hbar^{s} \widehat{Y}_{\mathbf{r}}(\mathrm{H}, \hbar, q)\right] . \tag{3.33}
\end{equation*}
$$

If $b=1$ and $Q$ and $q$ are related by the mirror map (3.26),

$$
\begin{align*}
& Z_{\mathbf{p}}^{*}(\hbar, Q)=e\left(E^{+}\right) \mathrm{e}^{-\frac{e\left(E^{-}\right) f_{0}(q)}{\hbar}}\left[\left\{\mathrm{H}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathbf{p}} \tilde{Y}^{*}(\mathrm{H}, \hbar, q)\right. \\
& \left.\quad-\sum_{s=0}^{|\mathbf{p}|-b|\mathbf{p}|-b-s} \sum_{|\mathbf{r}|=0}^{\mathrm{r}} \mathrm{E}_{\mathbf{p}, s}^{(\mathbf{r})} \hbar^{s} \widehat{Y}_{\mathbf{r}}(\mathrm{H}, \hbar, q)\right]-\frac{e\left(E^{+}\right) \mathrm{H}^{\mathbf{p}} f_{0}(q)}{\hbar} \sum_{n=0}^{\infty} \frac{1}{(n+1)!}\left[-\frac{e\left(E^{-}\right) f_{0}(q)}{\hbar}\right]^{n}, \tag{3.34}
\end{align*}
$$

where

$$
\begin{equation*}
f_{0}(q) \equiv \sum_{\substack{\mathbf{d} \in \Lambda-0, \nu_{E}(\mathbf{d})=0 \\ D_{j}(\mathbf{d}) \geqslant 0 \forall j \in[N]}} q^{\mathbf{d}}(-1)^{L_{1}^{-}(\mathbf{d})+1}\left(-L_{1}^{-}(\mathbf{d})-1\right)!\frac{\prod_{i=1}^{a}\left(L_{i}^{+}(\mathbf{d})!\right)}{\prod_{j=1}^{N}\left(D_{j}(\mathbf{d})\right)!} \cdot 5^{5} \tag{3.35}
\end{equation*}
$$

Identities (3.33) and (3.34) follow by setting $\alpha=0$ in (4.35) and (4.36).
As in [CoZ], if $X_{M}^{\tau}=\mathbb{P}^{n-1}$ and $b \geqslant 2$, (3.33) can be be replaced by a simpler formula in terms of the power series $F(\mathrm{w}, q)$ in (3.24) above. Assume that $E \longrightarrow \mathbb{P}^{n-1}$ is as in Remark 3.4 and $\sum_{i=1}^{a} \ell_{i}^{+}-\sum_{i=1}^{b} \ell_{i}^{-}=n$. Similarly to CoZ],

$$
Z_{p}^{*}(\hbar, q)=\frac{e\left(E^{+}\right)}{e\left(E^{-}\right)} \times \begin{cases}\left\{\mathrm{H}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{p} \dot{Y}(\mathrm{H}, \hbar, q)-\mathrm{H}^{p}, & \text { if } p<b, \\ \mathrm{H}^{p} \frac{\mathrm{M}^{p-b} F(\mathrm{H}, q)}{I_{p-b}(q)}-\mathrm{H}^{p}, & \text { if } p \geqslant b,\end{cases}
$$

where the right-hand side should be first simplified in $\mathbb{Q}(H, \hbar)[[q]]$ to eliminate division by H and only afterwards viewed as an element in $H^{*}\left(\mathbb{P}^{n-1}\right)\left[\hbar^{-1}\right][[q]]$. This follows from Remarks 4.4 and 3.4 together with Theorem 4.7. By Theorem 3.5 and Remark 3.4,

$$
\ddot{Z}_{p}(\hbar, q)= \begin{cases}\left\{\mathrm{H}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{p} \ddot{Y}(\mathrm{H}, \hbar, q), & \text { if } p<a \\ \mathrm{H}^{p} \frac{M^{p-a}\left(\frac{\mathrm{H}}{\hbar}, q\right)}{I_{p-a}(q)} & \\ \text { if } p \geqslant a\end{cases}
$$

The last two displayed equations together with (3.29) imply that

$$
\begin{equation*}
\sum_{d=1}^{\infty} d q^{d} \int_{\overline{\mathfrak{M}}_{0,2}\left(\mathbb{P}^{n-1}, d\right)} e\left(\mathcal{V}_{E}\right) \operatorname{ev}_{1}^{*} \mathrm{H}^{c_{1}} \operatorname{ev}_{2}^{*} \mathrm{H}^{c_{2}}=\frac{\prod_{i=1}^{a} \ell_{i}^{+}}{\prod_{i=1}^{b} \ell_{i}^{-}}\left(I_{c_{1}+1-b}(q)-1\right) \text { and } I_{c_{1}+1-b}=I_{c_{2}+1-b} \tag{3.36}
\end{equation*}
$$

whenever $c_{1}+c_{2}=n-2-a+b$ and with $I_{p}(q)$ defined by (3.24) if $p \geqslant 0$ and $I_{p}(q) \equiv 1$ if $p<0$.

[^2]
## Chapter 4

## Equivariant theorems

In this chapter we introduce equivariant versions of the GW generating functions $\dot{Z}$, $\dot{Z}_{\eta}$, and $\ddot{Z}_{\eta}$ of (1.8) and (1.9). We then present theorems about them which imply the non-equivariant statements of Section 3.2.

With $\alpha \equiv\left(\alpha_{1}, \ldots, \alpha_{N}\right)$ denoting the $\mathbb{T}^{N}$-weights of Section [2.3, $H_{\mathbb{T}_{N}}^{*}\left(X_{M}^{\tau}\right)$ is generated over $\mathbb{Q}[\alpha]$ by $\left\{x_{1}, \ldots, x_{k}\right\}$; see Proposition 2.21, The classes $x_{i}$ of (2.27) satisfy

$$
H_{\mathbb{T}^{N}}^{2}\left(X_{M}^{\tau}\right) \ni x_{i} \xrightarrow{\text { restriction }} \mathrm{H}_{i} \in H^{2}\left(X_{M}^{\tau}\right) \quad \forall i \in[k], \quad \mathbf{e}\left(\gamma_{i}^{*}\right)=x_{i} \quad \forall i \in[k],
$$

where $\mathbf{e}\left(\gamma_{i}^{*}\right)$ is defined by the lift (2.23) of the action of $\mathbb{T}^{N}$ on $X_{M}^{\tau}$ to the line bundle $\gamma_{i}^{*}$. Let

$$
x \equiv\left(x_{1}, \ldots, x_{k}\right), \quad x^{\mathbf{p}} \equiv x_{1}^{p_{1}} \cdot \ldots \cdot x_{k}^{p_{k}} \quad \forall \mathbf{p}=\left(p_{1}, \ldots, p_{k}\right) \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k} .
$$

The action of $\mathbb{T}^{N}$ on $X_{M}^{\tau}$ induces an action on $\overline{\mathfrak{M}}_{0, m}\left(X_{M}^{\tau}, \mathbf{d}\right)$ which lifts to an action on the vector orbi-bundles $\mathcal{V}_{E}, \dot{\mathcal{V}}_{E}$, and $\ddot{\mathcal{V}}_{E}$ of (1.1) and (1.7). It also lifts to an action on the universal cotangent line bundle to the $i$-th marked point whose equivariant Euler class will also be denoted by $\psi_{i}$. The evaluation maps ev $i: \overline{\mathfrak{M}}_{0, m}\left(X_{M}^{\tau}, \mathbf{d}\right) \longrightarrow X_{M}^{\tau}$ are $\mathbb{T}^{N}$-equivariant.

With $\mathrm{ev}_{1}, \mathrm{ev}_{2}: \overline{\mathfrak{M}}_{0,3}\left(X_{M}^{\tau}, \mathbf{d}\right) \longrightarrow X_{M}^{\tau}$ denoting the evaluation maps at the first two marked points, let

$$
\begin{equation*}
\dot{\mathcal{Z}}\left(\hbar_{1}, \hbar_{2}, Q\right) \equiv \frac{\hbar_{1} \hbar_{2}}{\hbar_{1}+\hbar_{2}} \sum_{\mathbf{d} \in \Lambda} Q^{\mathbf{d}}\left(\mathrm{ev}_{1} \times \mathrm{ev}_{2}\right)_{*}\left[\frac{\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right)}{\left(\hbar_{1}-\psi_{1}\right)\left(\hbar_{2}-\psi_{2}\right)}\right] . \tag{4.1}
\end{equation*}
$$

With $\mathrm{ev}_{1}, \mathrm{ev}_{2}: \overline{\mathfrak{M}}_{0,2}\left(X_{M}^{\tau}, \mathbf{d}\right) \longrightarrow X_{M}^{\tau}$ denoting the evaluation maps at the two marked points and for all $\eta \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right)$, let

$$
\begin{align*}
& \dot{\mathcal{Z}}_{\eta}(\hbar, Q) \equiv \eta+\sum_{\mathbf{d} \in \Lambda-0} Q^{\mathbf{d}} \mathrm{ev}_{1 *}\left[\frac{\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right) \mathrm{ev}_{2}^{*} \eta}{\hbar-\psi_{1}}\right] \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right)\left[\left[\hbar^{-1}, \Lambda\right]\right], \\
& \ddot{\mathcal{Z}}_{\eta}(\hbar, Q) \equiv \eta+\sum_{\mathrm{d} \in \Lambda-0} Q^{\mathbf{d}} \mathrm{ev}_{1 *}\left[\frac{\mathbf{e}\left(\ddot{\mathcal{V}}_{E}\right) \mathrm{ev}_{2}^{*} \eta}{\hbar-\psi_{1}}\right] \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right)\left[\left[\hbar^{-1}, \Lambda\right]\right] . \tag{4.2}
\end{align*}
$$

In the $\eta=x^{\mathbf{p}}$ cases, these are equivariant versions of $\dot{Z}_{\mathbf{p}}$ and $\ddot{Z}_{\mathbf{p}}$ in (3.1):

$$
\begin{equation*}
\dot{\mathcal{Z}}_{\mathbf{p}}(\hbar, Q) \equiv \dot{\mathcal{Z}}_{x^{\mathbf{p}}}(\hbar, Q), \ddot{\mathcal{Z}}_{\mathbf{p}}(\hbar, Q) \equiv \ddot{\mathcal{Z}}_{x^{\mathbf{p}}}(\hbar, Q) \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right)\left[\left[\hbar^{-1}, \Lambda\right]\right] . \tag{4.3}
\end{equation*}
$$

In particular, $\dot{\mathcal{Z}}_{0} \equiv \dot{\mathcal{Z}}_{1}$, with $\mathbf{0} \in \mathbb{Z}^{k}$ and $1 \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right)$.
Section4.1 below constructs the explicit formal power series in terms of which $\dot{\mathcal{Z}}_{\mathrm{p}}$ and $\ddot{\mathcal{Z}}_{\mathrm{p}}$ are expressed in Theorem4.7. Throughout this construction, which extends the constructions in [Z1, Section 2.3] and [PoZ, Section 3.1] from $\mathbb{P}^{n-1}$ to an arbitrary toric manifold $X_{M}^{\tau}$, we assume that $\nu_{E}(\mathbf{d}) \geqslant 0$ for all $\mathbf{d} \in \Lambda$ and identify $H_{2}\left(X_{M}^{\tau} ; \mathbb{Z}\right) \cong \mathbb{Z}^{k}$ via the basis $\left\{\mathrm{H}_{1}, \ldots, \mathrm{H}_{k}\right\}$ of $H^{2}\left(X_{M}^{\tau} ; \mathbb{Z}\right)$. Via this identification $\Lambda \hookrightarrow \mathbb{Z}^{k}$.

### 4.1 Construction of equivariant power series

We begin by defining equivariant versions $\dot{\mathcal{Y}}$ and $\ddot{\mathcal{Y}}$ of the power series $\dot{Y}$ and $\ddot{Y}$ in (3.7) as these will compute $\dot{\mathcal{Z}}_{\mathrm{p}}$ and $\ddot{\mathcal{Z}}_{\mathrm{p}}$ in Theorem4.7. We consider the lift (2.23) of the $\mathbb{T}^{N}$-action on $X_{M}^{\tau}$ to the line bundles $L_{i}^{ \pm}$of (1.5) and (3.5) so that

$$
\begin{equation*}
\lambda_{i}^{ \pm} \equiv \mathbf{e}\left(L_{i}^{ \pm}\right)=\sum_{r=1}^{k} \ell_{r i}^{ \pm} x_{r} \tag{4.4}
\end{equation*}
$$

An equivariant version of the power series $U(\mathbf{d} ; \mathrm{A}, \hbar)$ in (3.4) is given by

$$
\begin{equation*}
u(\mathbf{d} ; \mathrm{A}, \hbar) \equiv \frac{\prod_{\substack{j \in[N] \\ D_{j}(\mathbf{d})<0}} \prod_{\substack{j=D_{j}(\mathbf{d})+1}}^{0}\left(\sum_{i=1}^{k} m_{i j} \mathrm{~A}_{i}-\alpha_{j}+s \hbar\right)}{\prod_{\substack{j \in[N] \\ D_{j}(\mathbf{d}) \geqslant 0}} \prod_{s=1}^{D_{j}(\mathbf{d})}\left(\sum_{i=1}^{k} m_{i j} \mathrm{~A}_{i}-\alpha_{j}+s \hbar\right)} \in \mathbb{Q}[\alpha, \mathrm{A}] \Pi \hbar \Pi . \tag{4.5}
\end{equation*}
$$

By (2.29),

$$
\begin{equation*}
u(\mathbf{d} ; x, \hbar)=\frac{\prod_{\substack{j \in[N] \\ D_{j}(\mathbf{d})<0}} \prod_{\substack{j=D_{j}(\mathbf{d})+1}}^{0}\left(u_{j}+s \hbar\right)}{\prod_{\substack{j \in[N] \\ D_{j}(\mathbf{d}) \geqslant 0}} \prod_{s=1}^{D_{j}(\mathbf{d})}\left(u_{j}+s \hbar\right)} \tag{4.6}
\end{equation*}
$$

With $\dot{E}(\mathbf{d} ; \mathrm{A}, \hbar)$ and $\ddot{E}(\mathbf{d} ; \mathrm{A}, \hbar)$ as in (3.6), let

$$
\begin{align*}
& \dot{\mathcal{Y}}(\mathrm{A}, \hbar, q) \equiv \sum_{\mathbf{d} \in \Lambda} q^{\mathbf{d}} u(\mathbf{d} ; \mathrm{A}, \hbar) \dot{E}(\mathbf{d} ; \mathrm{A}, \hbar) \in \mathbb{Q}[\alpha, \mathrm{A}]\left[\left[\hbar^{-1}, \Lambda\right]\right] \\
& \ddot{\mathcal{Y}}(\mathrm{A}, \hbar, q) \equiv \sum_{\mathbf{d} \in \Lambda} q^{\mathrm{d}} u(\mathbf{d} ; \mathrm{A}, \hbar) \ddot{E}(\mathbf{d} ; \mathrm{A}, \hbar) \in \mathbb{Q}[\alpha, \mathrm{A}]\left[\left[\hbar^{-1}, \Lambda\right]\right] \tag{4.7}
\end{align*}
$$

In the above definitions of $\dot{\mathcal{Y}}$ and $\ddot{\mathcal{Y}}$ and throughout the construction below, the torus weights $\alpha$ should be thought of as formal variables, in the same way in which A of Section 3.1 are formal variables. With A replaced by $x, \dot{\mathcal{Y}}$ and $\ddot{\mathcal{Y}}$ become well-defined elements in $H_{\mathbb{T} N}^{*}\left(X_{M}^{\tau}\right)\left[\left[\hbar^{-1}, \Lambda\right]\right]$. However, this is irrelevant for the purposes of this section and becomes relevant only when we use $\dot{\mathcal{Y}}$ and $\ddot{\mathcal{Y}}$ in the formulas for $\dot{\mathcal{Z}}_{\mathrm{p}}$ and $\ddot{\mathcal{Z}}_{\mathrm{p}}$.

As before, $\mathbb{Q}_{\alpha} \equiv \mathbb{Q}(\alpha)$. We next describe an operator $\mathfrak{D}^{\text {p }}$ acting on a subset of $\mathbb{Q}_{\alpha}(\mathrm{A}, \hbar)[[\Lambda]]$ and certain associated "equivariant structure coefficients" in $\mathbb{Q}[\alpha][[\Lambda]]$ which occur in the formulas for $\dot{\mathcal{Z}}_{\mathbf{p}}$ and $\ddot{\mathcal{Z}}_{\mathbf{p}}$. Fix an element $\mathcal{Y}(\mathrm{A}, \hbar, q) \in \mathbb{Q}_{\alpha}(\mathrm{A}, \hbar)[[\Lambda]]$ such that for all $\mathbf{d} \in \Lambda$

$$
\llbracket \mathcal{Y}(\mathrm{A}, \hbar, q) \rrbracket_{q ; \mathbf{d}} \equiv \frac{f_{\mathbf{d}}(\mathrm{A}, \hbar)}{g_{\mathbf{d}}(\mathrm{A}, \hbar)}
$$

for some homogeneous polynomials $f_{\mathbf{d}}(\mathrm{A}, \hbar), g_{\mathbf{d}}(\mathrm{A}, \hbar) \in \mathbb{Q}[\alpha, \mathrm{A}, \hbar]$, symmetric in $\alpha$, and satisfying

$$
\begin{equation*}
f_{\mathbf{0}}(\mathrm{A}, \hbar)=g_{\mathbf{0}}(\mathrm{A}, \hbar), \quad \operatorname{deg} f_{\mathbf{d}}-\operatorname{deg} g_{\mathbf{d}}=-\nu_{E}(\mathbf{d}),\left.\quad g_{\mathbf{d}}\right|_{\substack{\mathrm{A}=0 \\ \alpha=0}} \neq 0 \quad \forall \mathbf{d} \in \Lambda \tag{4.8}
\end{equation*}
$$

This condition is satisfied by the power series $\dot{\mathcal{Y}}$ and $\ddot{\mathcal{Y}}$ of (4.7) and so the construction below applies to $\mathcal{Y}=\dot{\mathcal{Y}}$ and $\mathcal{Y}=\ddot{\mathcal{Y}}$. We inductively define $\mathfrak{D}^{\mathrm{P}} \mathcal{Y}(\mathrm{A}, \hbar, q)$ in $\mathbb{Q}_{\alpha}(\mathrm{A}, \hbar)[[\Lambda]]$ satisfying (EP1) with $\mathbf{D}^{\mathbf{p}}$ defined in Section 3.1,

$$
\left.\mathfrak{D}^{\mathrm{p}} \mathcal{Y}(\mathrm{~A}, \hbar, q)\right|_{\alpha=0}=\mathbf{D}^{\mathrm{p}}\left(\left.\mathcal{Y}(\mathrm{~A}, \hbar, q)\right|_{\alpha=0}\right) ;
$$

(EP2) there exist $\mathcal{C}_{\mathbf{p}, s}^{(\mathbf{r})} \equiv \mathcal{C}_{\mathbf{p}, s}^{(\mathbf{r})}(\mathcal{Y}) \in \mathbb{Q}[\alpha][[\Lambda]]$ with $\mathbf{p}, \mathbf{r} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k}, s \in \mathbb{Z}^{\geqslant 0}$, such that $\llbracket \mathcal{C}_{\mathbf{p}, s}^{(\mathbf{r})} \rrbracket_{q ; \mathbf{d}}$ is a homogeneous symmetric polynomial in $\alpha$ of degree $-\nu_{E}(\mathbf{d})-|\mathbf{r}|+s$,

$$
\begin{align*}
& \mathfrak{D}^{\mathbf{p}} \mathcal{Y}(\mathrm{A}, \hbar, q)=\hbar^{|\mathbf{p}|} \sum_{s=0}^{\infty} \sum_{\mathbf{r} \in(\mathbb{Z} \geq 0)^{k}} \mathcal{C}_{\mathbf{p}, s}^{(\mathbf{r})}(q) \mathrm{A}^{\mathbf{r}} \hbar^{-s},  \tag{4.9}\\
& \llbracket \mathcal{C}_{\mathbf{p}, s}^{(\mathbf{r})} \rrbracket_{q ; \overline{0}}=\delta_{\mathbf{p}, \mathbf{r}} \delta_{|\mathbf{r}|, s} \quad \forall \mathbf{p}, \mathbf{r} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k}, s \in \mathbb{Z}^{\geqslant 0} . \tag{4.10}
\end{align*}
$$

By (4.8), (3.12), and since $\llbracket\left\{J_{0}\left(\left.\mathcal{Y}\right|_{\alpha=0}\right)\right\}(1) \rrbracket_{q ; 0}=1$ by (P1), we can define

$$
\begin{equation*}
\mathfrak{D}^{0} \mathcal{Y}(\mathrm{~A}, \hbar, q) \equiv\left[\left\{J_{0}\left(\left.\mathcal{Y}\right|_{\alpha=0}\right)\right\}(1)\right]^{-1} \mathcal{Y}(\mathrm{~A}, \hbar, q) \in \mathbb{Q}_{\alpha}(\mathrm{A}, \hbar)[[\Lambda]] . \tag{4.11}
\end{equation*}
$$

Suppose next that $p \geqslant 0$ and we have constructed power series $\mathfrak{D}^{\mathrm{p}^{\prime}} \mathcal{Y}(\mathrm{A}, \hbar, q)$ for all $\mathbf{p}^{\prime} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k}$ with $\left|\mathbf{p}^{\prime}\right|=p$ satisfying the above properties. For each $\mathbf{p} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k}$ with $|\mathbf{p}|=p+1$, let

$$
\begin{align*}
& \tilde{\mathfrak{D}}^{\mathbf{P}} \mathcal{Y}(\mathrm{A}, \hbar, q) \equiv \frac{1}{|\operatorname{supp}(\mathbf{p})|} \sum_{i \in \operatorname{supp}(\mathbf{p})}\left\{\mathrm{A}_{i}+\hbar q_{i} \frac{\mathrm{~d}}{\mathrm{~d} q_{i}}\right\} \mathfrak{D}^{\mathbf{p}-e_{i}} \mathcal{Y}(\mathrm{~A}, \hbar, q) \in \mathbb{Q}_{\alpha}(\mathrm{A}, \hbar)[[\Lambda]],  \tag{4.12}\\
& \mathfrak{D}^{\mathrm{P}} \mathcal{Y}(\mathrm{~A}, \hbar, q) \equiv \sum_{\mathbf{p}^{\prime} \in(\mathbb{Z} \geq 0)^{k},\left|\mathbf{p}^{\prime}\right|=p+1} \mathrm{C}_{\mathbf{p} ; \mathbf{p}^{\prime}}(q) \tilde{\mathfrak{D}}^{\mathbf{p}^{\prime}} \mathcal{Y}(\mathrm{A}, \hbar, q),
\end{align*}
$$

where $\mathrm{c}_{\mathbf{p} ; \mathbf{p}^{\prime}}(q) \in \mathbb{Q}\left[\left[\Lambda ; \nu_{E}=0\right]\right]$ are defined by (3.16) with $\left.Y \equiv \mathcal{Y}\right|_{\alpha=0}$ and where $\left\{e_{1}, \ldots, e_{k}\right\}$ is the standard basis of $\mathbb{Z}^{k}$. Since (EP1) holds with $\mathbf{p}$ replaced by any $\mathbf{p}^{\prime}$ with $\left|\mathbf{p}^{\prime}\right|=p$,

$$
\left.\widetilde{\mathfrak{D}}^{\mathrm{p}} \mathcal{Y}(\mathrm{~A}, \hbar, q)\right|_{\alpha=0}=\widetilde{\mathbf{D}}^{\mathbf{p}}\left(\left.\mathcal{Y}(\mathrm{A}, \hbar, q)\right|_{\alpha=0}\right)
$$

by (3.13); thus, by the second equation in (4.12) and (3.17), $\mathfrak{D}^{\mathrm{p}} \mathcal{Y}$ satisfies (EP1). It is immediate to verify that $\mathfrak{D}^{\mathbf{P}} \mathcal{Y}(\mathrm{A}, \hbar, q)$ admits an expansion as in (4.9). Since $\llbracket \mathrm{c}_{\mathbf{p} ; \mathbf{p}^{\prime}} \rrbracket_{q: \mathbf{0}}=\delta_{\mathbf{p}, \mathbf{p}^{\prime}}$ by the second statement in (3.15) and (3.16) and (4.10) holds for $\mathbf{p}-e_{i}$ with $i \in \operatorname{supp}(\mathbf{p})$ instead of $\mathbf{p}$, (4.10) also holds for $\mathbf{p}$ with $|\mathbf{p}|=p+1$.

By (EP1), (3.10), and (4.9),

$$
\begin{equation*}
\left.\mathcal{C}_{\mathbf{p}, s}^{(\mathbf{r})}(\mathcal{Y})\right|_{\alpha=0}=\mathrm{C}_{\mathbf{p}, s}^{(\mathbf{r})}\left(\left.\mathcal{Y}\right|_{\alpha=0}\right), \tag{4.13}
\end{equation*}
$$

with $\mathrm{C}_{\mathbf{p}, s}^{(\mathrm{r})}$ as in (P2).
Define $\widetilde{\mathcal{C}}_{\mathbf{p}, \mathbf{s}}^{(r)} \equiv \widetilde{\mathcal{C}}_{\mathbf{p}, \mathbf{s}}^{(r)}(\mathcal{Y}) \in \mathbb{Q}[\alpha][[\Lambda]]$ for $\mathbf{p}, \mathbf{s} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k}$ and $r \in \mathbb{Z}^{\geqslant 0}$ with $|\mathbf{s}| \leqslant|\mathbf{p}|-r$ and $r \leqslant|\mathbf{p}|$ by

$$
\begin{equation*}
\sum_{t=0}^{r} \sum_{\substack{\mathbf{s} \in\left(\mathbb{Z}^{\geq 0}\right)^{k} \\|\mathbf{s}| \leqslant|\mathbf{p}|-t}} \widetilde{\mathcal{C}}_{\mathbf{p}, \mathbf{S}}^{(t)} \mathcal{C}_{\mathbf{s},|\mathbf{r}|+r-t}^{(\mathbf{r})}=\delta_{\mathbf{p}, \mathbf{r}} \delta_{r, 0} \quad \forall \mathbf{r} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k},|\mathbf{r}| \leqslant|\mathbf{p}|-r . \tag{4.14}
\end{equation*}
$$

Equations (4.14) indeed uniquely determine $\widetilde{\mathcal{C}}_{\mathbf{p}, \mathbf{s}}^{(r)}$, since

$$
\begin{equation*}
\sum_{t=0}^{r} \sum_{\substack{\mathbf{s} \in\left(\mathbb{Z} \geq 0 \\|\mathbf{Z}| \leqslant|\leqslant| \\ \mathbf{p}^{k}\right.}} \widetilde{\mathcal{C}}_{\mathbf{p},-\mathbf{S}}^{(t)} \mathcal{C}_{\mathbf{s},|\mathbf{r}|+r-t}^{(\mathbf{r})}=\sum_{t=0}^{r-1} \sum_{\substack{\mathbf{s} \in(\mathbb{Z} \geq 0 \\|\mathbf{s}| \leqslant|\mathbf{p}|-t}} \widetilde{\mathcal{C}}_{\mathbf{p}, \mathbf{s}}^{(t)} \mathcal{S}_{\mathbf{s},|\mathbf{r}|+r-t}^{(\mathbf{r})}+\sum_{\substack{\mathbf{s} \in(\mathbb{Z} \geq 0 \\|\mathbf{s}|<|\mathbf{r}|}} \widetilde{\mathcal{C}}_{\mathbf{p}, \mathbf{S}}^{(r)} \mathcal{C}_{\mathbf{s},|\mathbf{r}|}^{(\mathbf{r})}+\widetilde{\mathcal{C}}_{\mathbf{p}, \mathbf{r}}^{(r)} . \tag{4.15}
\end{equation*}
$$

This follows from

$$
\begin{equation*}
\mathcal{C}_{\mathbf{p},|\mathbf{r}|}^{(\mathbf{r})}=\delta_{\mathbf{p}, \mathbf{r}} \quad \text { if } \quad|\mathbf{r}| \leqslant|\mathbf{p}|, \tag{4.16}
\end{equation*}
$$

which in turn follows from (4.13), the second equation in (3.11), and the first property in (EP2). By (4.14) and (4.10),

$$
\begin{equation*}
\llbracket \widetilde{\mathcal{C}}_{\mathbf{p}, \mathbf{s}}^{(r)} \rrbracket_{q ; \mathbf{0}}=\delta_{\mathbf{p}, \mathbf{s}} \delta_{r, 0} . \tag{4.17}
\end{equation*}
$$

By (4.13), (3.19), (3.20), (4.14), (4.15), and induction,

$$
\begin{equation*}
\left.\widetilde{\mathcal{C}}_{\mathbf{p}, \mathbf{s}}^{(r)}(\mathcal{Y})\right|_{\alpha=0}=\widetilde{\mathrm{C}}_{\mathbf{p}, \mathbf{s}}^{(r)}\left(\left.\mathcal{Y}\right|_{\alpha=0}\right) . \tag{4.18}
\end{equation*}
$$

By (4.17) in the $\mathbf{d}=\mathbf{0}$ case and (4.14), (4.15), (EP2), and induction in all other cases, $\llbracket \widetilde{\mathcal{C}}_{\mathbf{p}, \mathbf{s}}^{(r)}(q) \rrbracket_{q ; \mathbf{d}}$ is a degree $r-\nu_{E}(\mathbf{d})$ homogeneous symmetric polynomial in $\alpha$. In particular, $\widetilde{\mathcal{C}}_{\mathrm{p}, \mathrm{s}}^{(0)}(q) \in \mathbb{Q}[[\Lambda]]$. This together with (4.18) and (3.22) implies that,

$$
\begin{equation*}
\widetilde{\mathcal{C}}_{\mathbf{p}, \mathbf{s}}^{(0)}(q)=\delta_{\mathbf{p}, \mathbf{s}} \quad \forall \mathbf{p}, \mathbf{s} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k} \quad \text { with } \quad|\mathbf{s}| \leqslant|\mathbf{p}| . \tag{4.19}
\end{equation*}
$$

Remark 4.1. By (4.11), $\left.\dot{\mathcal{Y}}\right|_{\alpha=0}=\dot{Y},\left.\ddot{\mathcal{Y}}\right|_{\alpha=0}=\ddot{Y}$, and Remark 3.1,

$$
\mathfrak{D}^{0} \dot{\mathcal{Y}}(\mathrm{~A}, \hbar, q)=\frac{1}{\dot{I}_{\mathbf{0}}(q)} \dot{\mathcal{Y}}(\mathrm{A}, \hbar, q), \quad \mathfrak{D}^{0} \ddot{\mathcal{Y}}(\mathrm{~A}, \hbar, q)=\frac{1}{\ddot{I}_{\mathbf{0}}(q)} \ddot{\mathcal{Y}}(\mathrm{A}, \hbar, q) .
$$

Remark 4.2. If $\nu_{E}(\mathbf{d})>0$ for all $\mathbf{d} \in \Lambda-\{0\}$ and $\mathcal{Y}(\mathrm{A}, \hbar, q) \in \mathbb{Q}_{\alpha}(\mathrm{A}, \hbar)[[\Lambda]]$ satisfies (4.8), then

$$
\mathfrak{D}^{\mathbf{p}} \mathcal{Y}(\mathrm{A}, \hbar, q)=\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathrm{p}} \mathcal{Y}(\mathrm{~A}, \hbar, q) \quad \forall \mathbf{p}=\left(p_{1}, \ldots, p_{k}\right) \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k} .
$$

This follows by induction on $|\mathbf{p}|$ from (4.12) since $\mathrm{c}_{\mathbf{p} ; \mathbf{p}^{\prime}}\left(\left.\mathcal{Y}\right|_{\alpha=0}\right)=\delta_{\mathbf{p}, \mathbf{p}^{\prime}}$ with $\mathrm{c}_{\mathbf{p} ; \mathbf{p}^{\prime}}$ defined by (3.16). The latter follows since $J_{p}\left(\left.\mathcal{Y}\right|_{\alpha=0}\right)=$ Id by Remark 3.2,

Remark 4.3. Suppose $p^{*} \in \mathbb{Z}^{\geqslant 0}, \mathcal{Y}(\mathrm{~A}, \hbar, q) \in \mathbb{Q}_{\alpha}(\mathrm{A}, \hbar)[[\Lambda]]$ satisfies (4.8), and

$$
\operatorname{deg}_{\hbar} f_{\mathbf{d}}(\mathrm{A}, \hbar)-\operatorname{deg}_{\hbar} g_{\mathbf{d}}(\mathrm{A}, \hbar)<-p^{*} \quad \forall \mathbf{d} \in \Lambda-0 .
$$

By the same reasoning as in Remark 4.2, but using Remark 3.3 instead of 3.2,

$$
\begin{equation*}
\mathfrak{D}^{\mathrm{p}} \mathcal{Y}(\mathrm{~A}, \hbar, q)=\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathbf{p}} \mathcal{Y}(\mathrm{A}, \hbar, q) \quad \text { if } \quad|\mathbf{p}| \leqslant p^{*} \tag{4.20}
\end{equation*}
$$

By (4.14), (4.15), and (4.19),

$$
\begin{equation*}
\mathcal{C}_{\mathbf{p},|\mathbf{r}|+r}^{(\mathbf{r})}+\sum_{t=1}^{r-1} \sum_{\substack{\mathbf{s} \in(\mathbb{Z} \geq 0 \\|\mathbf{s}| \leqslant|\mathbf{p}|-t}} \widetilde{\mathcal{C}}_{\mathbf{p}, \mathbf{s}}^{(t)} \mathcal{C}_{\mathbf{s},|\mathbf{r}|+r-t}^{(\mathbf{r})}+\sum_{\substack{\mathbf{s} \in(\mathbb{Z} \geq 0 \\|\mathbf{S}|<|\mathbf{r}|}} \widetilde{\mathcal{C}}_{\mathbf{p}, \mathbf{S}}^{(r)} \mathcal{C}_{\mathbf{s},|\mathbf{r}|}^{(\mathbf{r})}+\widetilde{\mathcal{C}}_{\mathbf{p}, \mathbf{r}}^{(r)}=0 \tag{4.21}
\end{equation*}
$$

if $r \geqslant 1$ and $|\mathbf{r}| \leqslant|\mathbf{p}|-r$. By (4.20) and (4.10),

$$
\mathfrak{D}^{\mathrm{p}} \mathcal{Y}(\mathrm{~A}, \hbar, q) \cong \mathrm{A}^{\mathrm{p}} \quad \bmod \hbar^{-1} \quad \text { if } \quad|\mathbf{p}| \leqslant p^{*}
$$

This together with (4.9) implies that whenever $|\mathbf{p}| \leqslant p^{*}$,

$$
\begin{equation*}
\mathcal{C}_{\mathbf{p},|\mathbf{r}|+r}^{(\mathbf{r})}=0 \quad \text { if } \quad r \geqslant 1 \quad \text { and } \quad|\mathbf{r}| \leqslant|\mathbf{p}|-r . \tag{4.22}
\end{equation*}
$$

Finally, using (4.21), (4.22), and induction, we find that

$$
\widetilde{\mathcal{C}}_{\mathbf{p}, \mathbf{s}}^{(r)}=0 \quad \text { if } \quad r \geqslant 1, \quad|\mathbf{p}| \leqslant p^{*}, \quad|\mathbf{s}| \leqslant|\mathbf{p}|-r .
$$

Remark 4.4. Let $(M, \tau)$ be the toric pair of Example 2.22 with $N=n$ so that $X_{M}^{\tau}=\mathbb{P}^{n-1}$ and $E \longrightarrow \mathbb{P}^{n-1}$ be as in Remark 3.4. By (4.7),

$$
\begin{aligned}
& \dot{\mathcal{Y}}(\mathrm{A}, \hbar, q)=\sum_{d=0}^{\infty} q^{d} \frac{\prod_{i=1}^{a} \prod_{s=1}^{\ell_{i}^{+} d}\left(\ell_{i}^{+} \mathrm{A}+s \hbar\right) \prod_{i=1}^{b} \prod_{s=0}^{-\ell_{i}^{-} d-1}\left(\ell_{i}^{-} \mathrm{A}-s \hbar\right)}{\prod_{j=1}^{n} \prod_{s=1}^{d}\left(\mathrm{~A}-\alpha_{j}+s \hbar\right)}, \\
& \ddot{\mathcal{Y}}(\mathrm{A}, \hbar, q)=\sum_{d=0}^{\infty} q^{d} \frac{\prod_{i=1}^{a} \prod_{s=0}^{\ell_{i}^{+} d-1}\left(\ell_{i}^{+} \mathrm{A}+s \hbar\right) \prod_{i=1}^{b} \prod_{s=1}^{-\ell_{i}^{-} d}\left(\ell_{i}^{-} \mathrm{A}-s \hbar\right)}{\prod_{j=1}^{n} \prod_{s=1}^{d}\left(\mathrm{~A}-\alpha_{j}+s \hbar\right)} .
\end{aligned}
$$

By Remark 4.3,

$$
\begin{aligned}
& \mathfrak{D}^{p} \dot{\mathcal{Y}}(\mathrm{~A}, \hbar, q)=\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{p} \dot{\mathcal{Y}}(\mathrm{~A}, \hbar, q) \quad \text { and } \quad \widetilde{\mathcal{C}}_{p, s}^{(r)}(\dot{\mathcal{Y}})=0 \quad \forall p<b, 1 \leqslant r \leqslant p, \\
& \mathfrak{D}^{p} \ddot{\mathcal{Y}}(\mathrm{~A}, \hbar, q)=\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{p} \ddot{\mathcal{Y}}(\mathrm{~A}, \hbar, q) \quad \text { and } \quad \widetilde{\mathcal{C}}_{p, s}^{(r)}(\ddot{\mathcal{Y}})=0 \quad \forall p<a, 1 \leqslant r \leqslant p .
\end{aligned}
$$

If $\sum_{i=1}^{a} \ell_{i}^{+}-\sum_{i=1}^{b} \ell_{i}^{-}<n$, then

$$
\mathfrak{D}^{p} \dot{\mathcal{Y}}=\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{p} \dot{\mathcal{Y}}, \quad \mathfrak{D}^{p} \ddot{\mathcal{Y}}=\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{p} \ddot{\mathcal{Y}},
$$

for all $p$ by Remark 4.2. If $\sum_{i=1}^{a} \ell_{i}^{+}-\sum_{i=1}^{b} \ell_{i}^{-}=n$, then

$$
\begin{array}{ll}
\mathfrak{D}^{b} \dot{\mathcal{Y}}=\frac{1}{I_{0}(q)}\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{b} \dot{\mathcal{Y}}, & \mathfrak{D}^{p} \dot{\mathcal{Y}}=\frac{1}{I_{p-b}(q)}\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\} \mathfrak{D}^{p-1} \dot{\mathcal{Y}}
\end{array} \quad \forall p>b,
$$

by (4.12) and Remark 3.4.

### 4.2 Equivariant statements

Theorem 4.5. Suppose $(M, \tau)$ is a minimal toric pair and $\operatorname{pr}_{i}: X_{M}^{\tau} \times X_{M}^{\tau} \longrightarrow X_{M}^{\tau}$ is the projection onto the $i$-th component. If $\eta_{j}, \breve{\eta}_{j} \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right)$ are such that

$$
\sum_{j=1}^{s} \operatorname{pr}_{1}^{*} \eta_{j} \operatorname{pr}_{2}^{*} \check{\eta}_{j} \in H_{\mathbb{T}^{N}}^{2(N-k)}\left(X_{M}^{\tau} \times X_{M}^{\tau}\right)
$$

is the equivariant Poincaré dual of the diagonal, then

$$
\begin{equation*}
\dot{\mathcal{Z}}\left(\hbar_{1}, \hbar_{2}, Q\right)=\frac{1}{\hbar_{1}+\hbar_{2}} \sum_{j=1}^{s} \operatorname{pr}_{1}^{*} \dot{\mathcal{Z}}_{\eta_{j}}\left(\hbar_{1}, Q\right) \operatorname{pr}_{2}^{*} \ddot{\mathcal{Z}}_{\dddot{\eta}_{j}}\left(\hbar_{2}, Q\right) . \tag{4.23}
\end{equation*}
$$

Corollary 4.6. Let $(M, \tau)$ be the minimal toric pair 2.37) so that $X_{M}^{\tau}=\prod_{i=1}^{s} \mathbb{P}^{N_{i}-1}, N=\sum_{i=1}^{s} N_{i}$, and $H_{\mathbb{T}^{N}}^{*}\left(\prod_{i=1}^{s} \mathbb{P}^{N_{i}-1}\right)$ is given by (2.38). Let $\mathrm{pr}_{j}: X_{M}^{\tau} \times X_{M}^{\tau} \longrightarrow X_{M}^{\tau}$ denote the projection onto the $j$-th component. For all $i \in[s]$ and $r \in \mathbb{Z}^{\geqslant 0}$, denote by $\sigma_{r}^{(i)}$ the $r$-th elementary symmetric polynomial in $\alpha_{1}^{(i)}, \ldots, \alpha_{N_{i}}^{(i)}$. Then,

$$
\dot{\mathcal{Z}}\left(\hbar_{1}, \hbar_{2}, Q\right)=\frac{1}{\hbar_{1}+\hbar_{2}} \sum_{\substack{r_{i}+a_{i}+b_{i}=N_{i}-1 \forall i \in[s] \\ r_{i}, a_{i}, b_{i} \geqslant 0 \forall \forall \in[s]}}(-1)^{\sum_{i=1}^{s} r_{i}} \sigma_{r_{1}}^{(1)} \ldots \sigma_{r_{s}}^{(s)} \operatorname{pr}_{1}^{*} \dot{\mathcal{Z}}_{\left(a_{1}, \ldots, a_{s}\right)}\left(\hbar_{1}, Q\right) \operatorname{pr}_{2}^{*} \ddot{\mathcal{Z}}_{\left(b_{1}, \ldots, b_{s}\right)}\left(\hbar_{2}, Q\right) .
$$

This follows from Theorem 4.5 as the equivariant Poincaré dual to the diagonal in $\prod_{i=1}^{s} \mathbb{P}^{N_{i}-1}$ is

$$
\sum_{\substack{r_{i}+a_{i}+b_{i}=N_{i}-1 \forall i \in[s] \\ r_{i}, a_{i}, b_{i} \geqslant 0 \forall i \in[s]}}(-1)^{\sum_{i=1}^{s} r_{i}} \sigma_{r_{1}}^{(1)} \ldots \sigma_{r_{s}}^{(s)} \operatorname{pr}_{1}^{*}\left(x_{1}^{a_{1}} \ldots x_{s}^{a_{s}}\right) \operatorname{pr}_{2}^{*}\left(x_{1}^{b_{1}} \ldots x_{s}^{b_{s}}\right) .
$$

Theorem 4.7. Let $(M, \tau)$ be a minimal toric pair. If $\nu_{E}(\mathbf{d}) \geqslant 0$ for all $\mathbf{d} \in \Lambda$, then $\dot{\mathcal{Z}}_{\mathbf{p}}$ and $\ddot{\mathcal{Z}}_{\mathrm{p}}$ of (4.3) and (4.2) are given by

$$
\begin{align*}
& \left.\dot{\mathcal{Z}}_{\mathbf{p}}(\hbar, Q)=\mathrm{e}^{-\frac{1}{\hbar}\left[G(q)+\sum_{i=1}^{k} x_{i} f_{i}(q)+\sum_{j=1}^{N} \alpha_{j} g_{j}(q)\right]} \dot{\mathcal{Y}}_{\mathbf{p}}(x, \hbar, q) \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right) \llbracket \hbar\right\rceil[[\Lambda]], \\
& \left.\ddot{\mathcal{Z}}_{\mathbf{p}}(\hbar, Q)=\mathrm{e}^{-\frac{1}{\hbar}\left[G(q)+\sum_{i=1}^{k} x_{i} f_{i}(q)+\sum_{j=1}^{N} \alpha_{j} g_{j}(q)\right]} \ddot{\mathcal{Y}}_{\mathbf{p}}(x, \hbar, q) \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right) \llbracket \hbar\right\rceil[[\Lambda]], \tag{4.24}
\end{align*}
$$

where

$$
\begin{align*}
& \dot{\mathcal{Y}}_{\mathbf{p}}(x, \hbar, q) \equiv \mathfrak{D}^{\mathrm{p}} \dot{\mathcal{Y}}(x, \hbar, q)+\sum_{r=1}^{|\mathbf{p}|} \sum_{|\mathbf{s}|=0}^{|\mathbf{p}|-r} \dot{\tilde{\mathcal{C}}}_{\mathbf{p}, \mathbf{s}}^{(r)}(q) \hbar^{|\mathbf{p}|-r-|\mathbf{s}|} \mathfrak{D}^{\mathbf{s}} \dot{\mathcal{Y}}(x, \hbar, q),  \tag{4.25}\\
& \ddot{\mathcal{Y}}_{\mathbf{p}}(x, \hbar, q) \equiv \mathfrak{D}^{\mathrm{p}} \ddot{\mathcal{Y}}(x, \hbar, q)+\sum_{r=1}^{|\mathbf{p}|} \sum_{|\mathbf{s}|=0}^{|\mathbf{p}|-r} \ddot{\tilde{\mathcal{C}}}_{\mathbf{p}, \mathbf{s}}^{(r)}(q) \hbar^{|\mathbf{p}|-r-|\mathbf{s}|} \mathfrak{D}^{\mathbf{s}} \ddot{\mathcal{Y}}(x, \hbar, q),
\end{align*}
$$

with $\left.\dot{\mathcal{C}}_{\mathbf{p}, \mathbf{s}}^{(r)} \equiv \widetilde{\mathcal{C}}_{\mathbf{p}, \mathbf{s}}^{(r)} \dot{\mathcal{Y}}\right)$ and $\ddot{\mathcal{\mathcal { C }}}_{\mathbf{p}, \mathbf{s}}^{(r)} \equiv \widetilde{\mathcal{C}}_{\mathbf{p}, \mathbf{s}}^{(r)}(\ddot{\mathcal{Y}})$ defined by 4.14$), Q$ and $q$ related by the mirror map (3.26), $G, f_{i}$ and $g_{j} \in \mathbb{Q}\left[\left[\Lambda-0 ; \nu_{E}=0\right]\right] 6$ given by (3.27), (3.25), and (5.1), and the operator $\mathfrak{D}^{\mathbf{p}}$ defined by (4.12). The coefficient of $q^{\mathbf{d}}$ within each of $\dot{\mathcal{C}}_{\mathbf{p}, \mathbf{s}}^{(r)}$ and $\ddot{\widetilde{\mathcal{C}}}_{\mathbf{p}, \mathbf{s}}^{(r)}$ is a degree $r-\nu_{E}(\mathbf{d})$ homogeneous symmetric polynomial in $\alpha_{1}, \ldots, \alpha_{N}$.

If $|\mathbf{p}|<b, \mathfrak{D}^{\mathrm{p}} \dot{\mathcal{Y}}=\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathrm{p}} \dot{\mathcal{Y}}$ and $\dot{\widetilde{\mathcal{C}}}_{\mathbf{p}, \mathrm{s}}^{(r)}=0$ for all $r \in[|\mathbf{p}|]$. If $|\mathbf{p}|<a$ and $L_{i}^{+}(\mathbf{d}) \geqslant 1$ for all $i \in[a]$ and $\mathbf{d} \in \Lambda-\{0\}$, then $\mathfrak{D}^{\mathrm{p}} \ddot{\mathcal{Y}}=\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathbf{p}} \ddot{\mathcal{Y}}$ and $\ddot{\mathcal{\mathcal { C }}}_{\mathbf{p}, \mathbf{s}}^{(r)}=0$ for all $r \in[|\mathbf{p}|]$.

Corollary 4.8. If $\mathbf{p} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k}$ and $\max (|\mathbf{p}|, 1)<\nu_{E}(\mathbf{d})$ for all $\mathbf{d} \in \Lambda-\{0\}$, then

$$
\dot{\mathcal{Z}}_{\mathbf{p}}(\hbar, q)=\left\{x+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathbf{p}} \dot{\mathcal{Y}}(x, \hbar, q), \quad \ddot{\mathcal{Z}}_{\mathbf{p}}(\hbar, q)=\left\{x+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathrm{p}} \ddot{\mathcal{Y}}(x, \hbar, q)
$$

This follows from Theorem 4.7 and Remark 4.2.
Corollary 4.9. Let $g_{\mathbf{p s}} \in \mathbb{Q}[\alpha]$ be homogeneous polynomials such that $\sum_{|\mathbf{p}|+|\mathrm{s}| \leqslant N-k} g_{\mathrm{ps}} \operatorname{pr}_{1}^{*} x^{\mathbf{p}} \mathrm{pr}_{2}^{*} x^{\mathbf{s}}$ is the equivariant Poincaré dual to the diagonal in $X_{M}^{\tau}$, where $N-k$ is the complex dimension

[^3]of $X_{M}^{\tau}$. If $N>k$ and $\nu_{E}(\mathbf{d})>N-k$ for all $\mathbf{d} \in \Lambda-\{0\}$, then the two-point function $\dot{\mathcal{Z}}$ of (4.1) is given by
$$
\dot{\mathcal{Z}}\left(\hbar_{1}, \hbar_{2}, q\right)=\frac{1}{\hbar_{1}+\hbar_{2}} \sum_{|\mathbf{p}|+|\mathbf{s}| \leqslant N-k} g_{\mathbf{p s}} \operatorname{pr}_{1}^{*}\left\{x+\hbar_{1} q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathrm{p}} \dot{\mathcal{Y}}\left(x, \hbar_{1}, q\right) \mathrm{pr}_{2}^{*}\left\{x+\hbar_{2} q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathrm{s}} \ddot{\mathcal{Y}}\left(x, \hbar_{2}, q\right)
$$

This follows from Theorem 4.5 and Corollary 4.8.
Remark 4.10. In the inductive construction of $\mathfrak{D}^{\mathrm{p}} \mathcal{Y}$ with $\mathcal{Y}=\dot{\mathcal{Y}}$ or $\mathcal{Y}=\ddot{\mathcal{Y}}$, the first equation in (4.12) may be replaced by

$$
\tilde{\mathfrak{D}}^{\mathrm{p}} \mathcal{Y}(\mathrm{~A}, \hbar, q) \equiv \sum_{i \in \operatorname{supp}(\mathbf{p})} c_{\mathbf{p} ; i}\left\{\mathrm{~A}_{i}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\} \mathfrak{D}^{\mathbf{p}-e_{i}} \mathcal{Y}(\mathrm{~A}, \hbar, q) \in \mathbb{Q}_{\alpha}(\mathrm{A}, \hbar)[[\Lambda]],
$$

for any tuple $\left(c_{\mathbf{p} ; i}\right)_{i \in \operatorname{supp}(\mathbf{p})}$ of rational numbers with $\sum_{i \in \operatorname{supp}(\mathbf{p})} c_{\mathbf{p} ; i}=1$. The power series $\mathfrak{D}^{\mathbf{p}} \mathcal{Y}$ defined by the second equation in (4.12) in terms of the "new weighted" $\widetilde{\mathfrak{D}}^{\text {p }} \mathcal{Y}$ satisfy (EP1) and (EP2) with $\mathbf{D}^{\mathbf{p}}$ correspondingly "weighted" as in Remark 3.6. This follows by the same arguments as in the case when $c_{\mathbf{p} ; i}=\frac{1}{|\operatorname{supp}(\mathbf{p})|}$ for all $i \in \operatorname{supp}(\mathbf{p})$. Therefore, (4.14) continues to define power series $\widetilde{\mathcal{C}}_{\mathbf{p}, \mathbf{s}}^{(r)}(\mathcal{Y})$ in terms of the "new weighted" $\mathcal{C}_{\mathbf{p}, \mathbf{s}}^{(\mathbf{r})}(\mathcal{Y})$. The resulting "weighted" power series $\mathcal{Y}_{\mathbf{p}}$ of (4.25) do not depend on the "weights" $c_{\mathbf{p}, i}$ as elements of $\left.H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right) \pi \hbar\right\rceil[[\Lambda]]$ by the proof of Theorem 4.7 outlined in Section 5.1.
Remark 4.11. We define an equivariant version of $Z^{*}$ in (1.10). Let

$$
\begin{equation*}
\mathcal{Z}^{*}\left(\hbar_{1}, \hbar_{2}, Q\right) \equiv \sum_{\mathbf{d} \in \Lambda-0} Q^{\mathbf{d}}\left(\operatorname{ev}_{1} \times \mathrm{ev}_{2}\right)_{*}\left[\frac{\mathbf{e}\left(\mathcal{V}_{E}\right)}{\left(\hbar_{1}-\psi_{1}\right)\left(\hbar_{2}-\psi_{2}\right)}\right], \tag{4.26}
\end{equation*}
$$

where $\mathrm{ev}_{1}, \mathrm{ev}_{2}: \overline{\mathfrak{M}}_{0,2}\left(X_{M}^{\tau}, \mathbf{d}\right) \longrightarrow X_{M}^{\tau}$. Since $\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right) \operatorname{ev}_{1}^{*} \mathbf{e}\left(E^{+}\right)=\mathbf{e}\left(\mathcal{V}_{E}\right) \operatorname{ev}_{1}^{*} \mathbf{e}\left(E^{-}\right)$,

$$
\dot{\mathcal{Z}}^{*}\left(\hbar_{1}, \hbar_{2}, Q\right) \operatorname{pr}_{1}^{*} \mathbf{e}\left(E^{+}\right)=\mathcal{Z}^{*}\left(\hbar_{1}, \hbar_{2}, Q\right) \operatorname{pr}_{1}^{*} \mathbf{e}\left(E^{-}\right)
$$

where $\dot{\mathcal{Z}}^{*}$ is obtained from $\dot{\mathcal{Z}}$ by disregarding the $Q^{\mathbf{0}}$ term and $\mathrm{pr}_{1}: X_{M}^{\tau} \times X_{M}^{\tau} \longrightarrow X_{M}^{\tau}$ is the projection onto the first component. This together with Theorem 4.5 expresses $\mathcal{Z}^{*}$ in terms of $\dot{\mathcal{Z}}_{\eta}$ and $\ddot{\mathcal{Z}}_{\eta}$ in the $E=E^{+}$case.

Using an idea from [CoZ], we derive a formula for $\mathcal{Z}^{*}$ in terms of one-point GW generating functions that holds in all cases. Following [CoZ], we then show how to express the latter in terms of explicit power series if $b>0$. If $\mathrm{pr}_{i}: X_{M}^{\tau} \times X_{M}^{\tau} \longrightarrow X_{M}^{\tau}$ and $g_{\mathrm{ps}} \in \mathbb{Q}[\alpha]$ are as in Corollary 4.9, then

$$
\begin{align*}
\mathcal{Z}^{*}\left(\hbar_{1}, \hbar_{2}, Q\right)=\frac{1}{\hbar_{1}+\hbar_{2}} \sum_{|\mathbf{p}|+|\mathbf{s}| \leqslant N-k} g_{\mathrm{ps}} & {\left[\operatorname{pr}_{1}^{*} x^{\mathbf{p}} \operatorname{pr}_{2}^{*} \mathcal{Z}_{\mathbf{s}}^{*}\left(\hbar_{2}, Q\right)\right.}  \tag{4.27}\\
& \left.+\operatorname{pr}_{1}^{*} \mathcal{Z}_{\mathbf{p}}^{*}\left(\hbar_{1}, Q\right) \operatorname{pr}_{2}^{*} \ddot{\mathcal{Z}}_{\mathbf{s}}\left(\hbar_{2}, Q\right)\right]
\end{align*}
$$

where

$$
\mathcal{Z}_{\mathbf{p}}^{*}(\hbar, Q) \equiv \sum_{\mathbf{d} \in \Lambda-0} Q^{\mathbf{d}} \mathrm{ev}_{1 *}\left[\frac{\mathbf{e}\left(\mathcal{V}_{E}\right) \mathrm{ev}_{2}^{*} x^{\mathbf{p}}}{\hbar-\psi_{1}}\right] \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right)\left[\left[\hbar^{-1}, \Lambda\right]\right] .
$$

This follows from Theorem 4.5, using that $\operatorname{pr}_{1}^{*}\left(\mathbf{e}\left(E^{+}\right) / \mathbf{e}\left(E^{-}\right)\right)\left(\dot{\mathcal{Z}}-\llbracket \dot{\mathcal{Z}} \rrbracket_{Q ; \mathbf{0}}\right)=\mathcal{Z}^{*}$, and

$$
\begin{equation*}
\operatorname{pr}_{1}^{*}\left(\frac{\mathbf{e}\left(E^{+}\right)}{\mathbf{e}\left(E^{-}\right)}\right) \sum_{|\mathbf{p}|+|\mathbf{s}| \leqslant N-k} g_{\mathrm{ps}} \operatorname{pr}_{1}^{*} x^{\mathbf{p}} \operatorname{pr}_{2}^{*}\left(\ddot{\mathcal{Z}}_{\mathbf{s}}(\hbar, Q)-x^{\mathbf{s}}\right)=\sum_{|\mathbf{p}|+|\mathbf{s}| \leqslant N-k} g_{\mathrm{ps}} \operatorname{pr}_{1}^{*} x^{\mathbf{p}} \operatorname{pr}_{2}^{*} \mathcal{Z}_{\mathbf{s}}^{*}(\hbar, Q) \tag{4.28}
\end{equation*}
$$

In the $X_{M}^{\tau}=\mathbb{P}^{n-1}$ case, (4.27) is [CoZ, (2.19)] and the proof of the $X_{M}^{\tau}=\mathbb{P}^{n-1}$ case of (4.28) in [CoZ] extends to the case of an arbitrary toric manifold.

We give another proof of (4.28), using the Virtual Localization Theorem (5.16) on $\overline{\mathfrak{M}}_{0,2}\left(X_{M}^{\tau}, \mathbf{d}\right)$ as in Section 5.4. We prove that (4.28) holds when restricted to $[I] \times[J]$ for arbitrary $I, J \in \mathscr{V}_{M}^{\tau}$. The left-hand side of (4.28) restricted to $[I] \times[J]$ is

$$
\begin{equation*}
\left.\left.\frac{\mathbf{e}\left(E^{+}\right)}{\mathbf{e}\left(E^{-}\right)}\right|_{[I]} \sum_{|\mathbf{p}|+|\mathbf{s}| \leqslant N-k} g_{\mathbf{p s}} x^{\mathbf{p}}\right|_{[I]} \sum_{\mathbf{d} \in \Lambda-0} Q^{\mathbf{d}} \int_{\left[\overline{\mathfrak{M}}_{0,2}\left(X_{M}^{\tau}, \mathbf{d}\right)\right]^{v i r}} \frac{\mathbf{e}\left(\ddot{\mathcal{V}}_{E}\right) \mathrm{ev}_{2}^{*} x^{\mathrm{s}} \mathrm{ev}_{1}^{*} \phi_{J}}{\hbar-\psi_{1}} . \tag{4.29}
\end{equation*}
$$

The right-hand side of (4.28) restricted to $[I] \times[J]$ is

$$
\begin{equation*}
\left.\sum_{|\mathbf{p}|+|\mathbf{s}| \leqslant N-k} g_{\mathrm{ps}} x^{\mathbf{p}}\right|_{[I]} \sum_{\mathbf{d} \in \Lambda-0} Q^{\mathbf{d}} \int_{\left[\bar{M}_{0,2}\left(X_{M}^{\tau}, \mathbf{d}\right)\right]^{v i r}} \frac{\mathbf{e}\left(\mathcal{V}_{E}\right) \mathrm{ev}_{2}^{*} x^{\mathrm{s}} \mathrm{ev}_{1}^{*} \phi_{J}}{\hbar-\psi_{1}} \tag{4.30}
\end{equation*}
$$

Since $\phi_{I}$ is the equivariant Poincaré dual of [ $\left.I\right]$,

$$
\left.\sum_{\mathbf{p}, \mathbf{s}} g_{\mathrm{ps}} \operatorname{pr}_{1}^{*} x^{\mathbf{p}} \operatorname{pr}_{2}^{*} x^{\mathbf{s}}\right|_{[I] \times[J]}=\int_{\Delta\left(X_{M}^{\tau}\right)} \operatorname{pr}_{1}^{*} \phi_{I} \operatorname{pr}_{2}^{*} \phi_{J}=\int_{X_{M}^{\tau}} \phi_{I} \phi_{J}=\phi_{I}(J)=0 \quad \forall I \neq J \in \mathscr{V}_{M}^{\tau},
$$

where $\Delta\left(X_{M}^{\tau}\right) \subset X_{M}^{\tau} \times X_{M}^{\tau}$ denotes the diagonal. Thus, by the Virtual Localization Theorem (5.16), a graph $\Gamma$ as in Section 5.4 may contribute to (4.29) or (4.30) only if its second marked point is mapped into [I]. Finally, (4.28) follows from the above since

$$
\left.\left.\frac{\mathbf{e}\left(E^{+}\right)}{\mathbf{e}\left(E^{-}\right)}\right|_{[I]} \mathbf{e}\left(\ddot{\mathcal{V}}_{E}\right)\right|_{\mathcal{Z}_{\Gamma}}=\left.\mathbf{e}\left(\mathcal{V}_{E}\right)\right|_{\mathcal{Z}_{\Gamma}}
$$

whenever $\mathcal{Z}_{\Gamma} \subset \overline{\mathfrak{M}}_{0,2}\left(X_{M}^{\tau}, \mathbf{d}\right)$ is the $\mathbb{T}^{N}$-pointwise fixed locus corresponding to a graph $\Gamma$ whose second marked point is mapped into [I].

We next assume that $b>0$ and $\nu_{E}(\mathbf{d}) \geqslant 0$ for all $\mathbf{d} \in \Lambda$ and express $\mathcal{Z}_{\mathbf{p}}^{*}(\hbar, Q)$ in terms of explicit power series. Along with (4.27) and Theorem4.7, this will conclude the computation of $\mathcal{Z}^{*}$.

We define

$$
\begin{equation*}
\widehat{\mathcal{Y}}(\mathrm{A}, \hbar, q) \equiv \sum_{\mathbf{d} \in \Lambda} q^{\mathbf{d}} u(\mathbf{d} ; \mathrm{A}, \hbar) \prod_{i=1}^{a} \prod_{s=1}^{L_{i}^{+}(\mathbf{d})}\left(\sum_{r=1}^{k} \ell_{r i}^{+} \mathrm{A}_{r}+s \hbar\right) \prod_{i=1}^{b} \prod_{s=1}^{-L_{i}^{-}(\mathbf{d})}\left(\sum_{r=1}^{k} \ell_{r i}^{-} \mathrm{A}_{r}-s \hbar\right) . \tag{4.31}
\end{equation*}
$$

As $\widehat{\mathcal{Y}}$ satisfies (4.8), we may define $\mathfrak{D}^{\mathrm{p}} \widehat{\mathcal{Y}}$ and $\widetilde{\mathcal{C}}_{\mathbf{p}, \mathbf{s}}^{(r)} \equiv \widetilde{\mathcal{C}}_{\mathbf{p}, \mathrm{s}}^{(r)}(\widehat{\mathcal{Y}})$ by (4.12) and (4.14). We define $\widehat{\mathcal{Y}}_{\mathbf{p}}(\mathrm{A}, \hbar, q)$ by the right-hand side of (4.25) above, with $\dot{\mathcal{Y}}$ replaced by $\hat{\mathcal{Y}}$ and $\tilde{\mathcal{C}}_{\mathbf{p}, \mathrm{s}}^{(r)}$ by $\widetilde{\mathcal{C}}_{\mathbf{p}, \mathrm{s}}^{(r)}$. Let

$$
\begin{equation*}
\tilde{\mathcal{Y}}^{*}(\mathrm{~A}, \hbar, q) \equiv \sum_{\mathbf{d} \in \Lambda-0} q^{\mathbf{d}} u(\mathbf{d} ; \mathrm{A}, \hbar) \prod_{i=1}^{a} \prod_{s=1}^{L_{i}^{+}(\mathbf{d})}\left(\sum_{r=1}^{k} \ell_{r i}^{+} \mathrm{A}_{r}+s \hbar\right) \prod_{i=1}^{b} \prod_{s=1}^{-L_{i}^{-}(\mathbf{d})-1}\left(\sum_{r=1}^{k} \ell_{r i}^{-} \mathrm{A}_{r}-s \hbar\right) \tag{4.32}
\end{equation*}
$$

Define $\mathcal{E}_{\mathbf{p}, \mathbf{s}}^{(\mathbf{r})} \in \mathbb{Q}[\alpha][[\Lambda]]$ by

$$
\begin{equation*}
\left\{\mathrm{A}+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathbf{p}} \tilde{\mathcal{Y}}^{*}(\mathrm{~A}, \hbar, q) \cong \sum_{s=0}^{|\mathbf{p}|-b|\mathbf{p}|-b-s} \sum_{|\mathbf{r}|=0}^{(\mathbf{E})} \mathcal{E}_{\mathbf{p}, s} \mathrm{~A}^{\mathrm{r}} \hbar^{s} \quad \bmod \hbar^{-1} . \tag{4.33}
\end{equation*}
$$

It follows that $\llbracket \mathcal{E}_{\mathbf{p}, \mathbf{s}}^{(\mathbf{r})} \rrbracket_{q ; \mathbf{d}}$ is a degree $|\mathbf{p}|-b-s-\nu_{E}(\mathbf{d})-|\mathbf{r}|$ symmetric homogeneous polynomial in $\alpha$. Then,

$$
\begin{equation*}
\dot{\mathcal{Y}}_{\mathbf{p}}(x, \hbar, Q)=\left\{x+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathbf{p}} \dot{\mathcal{Y}}(x, \hbar, q)-\mathbf{e}\left(E^{-}\right) \sum_{s=0}^{|\mathbf{p}|-b|\mathbf{p}|-b-s} \sum_{|\mathbf{r}|=0} \mathcal{E}_{\mathbf{p}, s}^{(\mathbf{r})} \hbar^{s} \widehat{\mathcal{Y}}_{\mathbf{r}}(x, \hbar, q), \tag{4.34}
\end{equation*}
$$

where $\dot{\mathcal{Y}}_{\mathrm{p}}$ is defined by (4.25); see Section 5.1 for a proof of (4.34).
Whenever $b \geqslant 2$,

$$
\begin{equation*}
\mathcal{Z}_{\mathbf{p}}^{*}(\hbar, q)=\mathbf{e}\left(E^{+}\right)\left[\left\{x+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathbf{p}} \tilde{\mathcal{Y}}^{*}(x, \hbar, q)-\sum_{s=0}^{|\mathbf{p}|-b|\mathbf{p}|-b-s} \sum_{|\mathbf{r}|=0} \mathcal{E}_{\mathbf{p}, s}^{(\mathbf{r})} \hbar^{s} \widehat{\mathcal{Y}}_{\mathbf{r}}(x, \hbar, q)\right] . \tag{4.35}
\end{equation*}
$$

If $b=1$,

$$
\begin{align*}
& \mathcal{Z}_{\mathbf{p}}^{*}(\hbar, Q)=\mathbf{e}\left(E^{+}\right) \mathrm{e}^{-\frac{\mathbf{e}\left(E^{-}\right) f_{0}(q)}{\hbar}}\left[\left\{x+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathbf{p}} \tilde{\mathcal{Y}}^{*}(x, \hbar, q)\right. \\
& \left.\quad-\sum_{s=0}^{|\mathbf{p}|-b|\mathbf{p}|-b-s} \sum_{|\mathbf{r}|=0} \mathcal{E}_{\mathbf{p}, s}^{(\mathbf{r})} \hbar^{s} \widehat{\mathcal{Y}}_{\mathbf{r}}(x, \hbar, q)\right]-\frac{\mathbf{e}\left(E^{+}\right) x^{\mathbf{p}} f_{0}(q)}{\hbar} \sum_{n=0}^{\infty} \frac{1}{(n+1)!}\left[-\frac{\mathbf{e}\left(E^{-}\right) f_{0}(q)}{\hbar}\right]^{n} \tag{4.36}
\end{align*}
$$

with $Q$ and $q$ related by the mirror map (3.26) and $f_{0}(q) \in \mathbb{Q}[[\Lambda]]$ given by (3.35). Equations (4.35) and (4.36) follow from $\mathcal{Z}_{\mathbf{p}}^{*}=\frac{\mathbf{e}\left(E^{+}\right)}{\mathbf{e}\left(E^{-}\right)}\left(\dot{\mathcal{Z}}_{\mathbf{p}}-x^{\mathbf{p}}\right)$, (4.24), and (4.34).

## Chapter 5

## Proofs

### 5.1 Outline

In this chapter, we prove Theorems 4.5 and 4.7 and the identity (4.34). The proofs of the two theorems are in the spirit of the proof of mirror symmetry in [Gi1] and [Gi2] but with a twist. Similarly to [Gi1] and [Gi2], our argument revolves around the restrictions on power series imposed by certain recursivity and polynomiality conditions. The concept of $C$-recursivity was first introduced in [Gi1] in the $X_{M}^{\tau}=\mathbb{P}^{n-1}$ case, extended to an arbitrary $X_{M}^{\tau}$ in [Gi2], and re-defined in [Z1]; all these definitions involve an explicit collection $C$ of structure coefficients. Our concept of $C$-recursivity introduced in Definition 5.2 extends the notion of $C$-recursivity with an arbitrary collection of structure coefficients from the $X_{M}^{\tau}=\mathbb{P}^{n-1}$ case considered in [PoZ] to an arbitrary $X_{M}^{\tau}$. The concept of (self-) polynomiality introduced in [Gi1] in the $X_{M}^{\tau}=\mathbb{P}^{n-1}$ case and extended to an arbitrary $X_{M}^{\tau}$ in [Gi2] was modified into the concept of mutual polynomiality for a pair of power series in the $X_{M}^{\tau}=\mathbb{P}^{n-1}$ case in [Z1]; we extend the latter to an arbitrary $X_{M}^{\tau}$ in Definition 5.5. By Proposition 5.6. which extends [Z1, Proposition 2.1] from the $X_{M}^{\tau}=\mathbb{P}^{n-1}$ case to an arbitrary $X_{M}^{\tau}, C$ recursivity and mutual polynomiality impose severe restrictions on power series, more severe than the restrictions imposed by recursivity and self-polynomiality as discovered in Gi1].

Analogous to [Z1] and [PoZ], the proof of Theorem 4.7 relies on the one-point mirror theorem of [LLY3]. We begin by stating it. The coefficient of $\alpha_{j} / \hbar$ for $j \in[N]$ in the Laurent expansion of $\left.\frac{1}{\frac{I_{0}(q)}{}} \dot{\mathcal{Y}}\right|_{\mathrm{A}=0}$ at $\hbar^{-1}=0$ is given by

$$
\begin{align*}
& g_{j}(q) \equiv \frac{\delta_{b, 0}}{\dot{I}_{\mathbf{0}}(q)}\left[\sum_{\substack{\mathbf{d} \in \Lambda, \nu_{E}(\mathbf{d})=0 \\
D_{s}(\mathbf{d}) \geqslant 0 \forall \Delta s \in[N]}} q^{\mathbf{d}} \frac{\prod_{i=1}^{a}\left[L_{i}^{+}(\mathbf{d})!\right]}{\prod_{r=1}^{N}\left[D_{r}(\mathbf{d})!\right]}\left(\sum_{s=1}^{D_{j}(\mathbf{d})} \frac{1}{s}\right)\right. \\
&+\sum_{\substack{\mathbf{d} \in \Lambda, \nu_{E}(\mathbf{d})=0 \\
D_{j}(\mathbf{d})<-1 \\
D_{s}(\mathbf{d}) \geqslant 0 \forall s \in[N]-\{j\}}} q^{\left.\mathbf{d}(-1)^{D_{j}(\mathbf{d})}\left[-D_{j}(\mathbf{d})-1\right]!\frac{\prod_{i=1}^{a}\left[L_{i}^{+}(\mathbf{d})!\right]}{\prod_{\substack{s \in[N]-\{j\}}}\left[D_{s}(\mathbf{d})!\right]}\right] .} . \tag{5.1}
\end{align*}
$$

By [LLY3, Theorem 4.7] together with LLY3, Section 5.2], if $\nu_{E}(\mathbf{d}) \geqslant 0$ for all $\mathbf{d} \in \Lambda$, then

$$
\begin{equation*}
\dot{\mathcal{Z}}_{\mathbf{0}}(\hbar, Q)=\frac{1}{\dot{I}_{\mathbf{0}}(q)} \mathrm{e}^{-\frac{1}{\hbar}\left[G(q)+\sum_{i=1}^{k} x_{i} f_{i}(q)+\sum_{j=1}^{N} \alpha_{j} g_{j}(q)\right]} \dot{\mathcal{Y}}(x, \hbar, q), \tag{5.2}
\end{equation*}
$$

with $Q$ and $q$ related by the mirror map (3.26), $G, f_{i}$, and $g_{j}$ defined by (3.27), (3.25), and (5.1) $]^{7}$

Remark 5.1. By (4.7), (3.27), and (3.25),

$$
\left.\dot{I}_{\mathbf{0}}(q) G(q) \equiv \llbracket \dot{\mathcal{Y}}(\mathrm{A}, \hbar, q)\right|_{\substack{\alpha=0 \\ \mathrm{~A}=0}} \rrbracket_{\hbar^{-1} ; 1} \quad \text { and } \quad \dot{I}_{\mathbf{0}}(q) f_{i}(q) \equiv \llbracket \dot{\mathcal{Y}}(\mathrm{A}, \hbar, q) \rrbracket_{\frac{\mathrm{A}_{i} ; 1}{\hbar}} \quad \forall i \in[k],
$$

where 【 $\rrbracket_{\hbar^{-1} ; 1}$ and $\llbracket \rrbracket_{\frac{A_{i} ; 1}{\hbar}}$ denote the coefficients of $\hbar^{-1}$ and $\frac{\mathrm{A}_{i}}{\hbar}$ respectively within the Laurent expansion around $\hbar^{-1}=0$ of the power series inside of the brackets. Thus,

$$
\llbracket \dot{\mathcal{Y}}(\mathrm{A}, \hbar, q) \rrbracket_{\hbar^{-1 ; 1}} \equiv \dot{I}_{\mathbf{0}}(q)\left[G(q)+\sum_{i=1}^{k} \mathrm{~A}_{i} f_{i}(q)+\sum_{j=1}^{N} \alpha_{j} g_{j}(q)\right] .
$$

Some of the proofs in this chapter also hold if we replace $\mathbb{Q}$ by any field $R \supseteq \mathbb{Q}$. Given such a field $R$, let

$$
R_{\alpha} \equiv \mathbb{Q}_{\alpha} \otimes_{\mathbb{Q}} R=R\left[\alpha_{1}, \ldots, \alpha_{N}\right]_{\langle P: P \in \mathbb{Q}[\alpha]-0\rangle} \quad \text { and } \quad H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau} ; R\right) \equiv H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right) \otimes_{\mathbb{Q}} R
$$

An element in $H_{\mathbb{T}_{N}}^{*}\left(X_{M}^{\tau} ; R\right) \pi \hbar \Pi[[\Lambda]]$ admits a lift to an element in $R[\alpha, x] \Pi \hbar \pi[[\Lambda]]$ and an element in $R[\alpha, x] \Pi \hbar \pi[[\Lambda]]$ induces an element in $\left.H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau} ; R\right) \Pi \hbar\right\rceil[[\Lambda]]$ via Proposition 2.21, Given $Y(\hbar, Q) \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau} ; R\right) \Pi \hbar \Pi\left[[[\Lambda]]\right.$ and $J \in \mathscr{V}_{M}^{\tau}$, we write

$$
\left.\left.\left.Y(\hbar, Q)\right|_{[J]} \text { or }\left.\quad Y(\hbar, Q)\right|_{J} \quad \text { or } \quad Y(x(J), \hbar, Q) \in R[\alpha] \Pi \hbar\right\rceil\right\rceil[[\Lambda]]
$$

for the power series obtained from $Y$ by replacing each coefficient of $\hbar^{s} Q^{\text {d }}$ in $Y$ by its image via the restriction map $\cdot(J)$ of (2.28).

In proving Theorem 4.7, we follow the steps outlined in [Z1, Section 1.3] and used for proving [Z1, Theorem 1.1]:
(M1) if $R \supseteq \mathbb{Q}$ is any field, $Y, Z \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau} ; R\right) \llbracket \hbar \Pi[[\Lambda]], Z(\hbar, Q)$ is $C$-recursive in the sense of Definition 5.2 and satisfies the mutual polynomiality condition (MPC) of Definition 5.5 with respect to $Y(\hbar, Q)$, the transforms of $Z(\hbar, Q)$ of Lemma 5.8 are also $C$-recursive and satisfy the MPC with respect to appropriate transforms of $Y(\hbar, Q)$;
(M2) if $R \supseteq \mathbb{Q}$ is any field, $Z \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau} ; R\right) \llbracket \hbar \Pi[[\Lambda]]$ is recursive in the sense of Definition 5.2 and $(Y, Z)$ satisfies the MPC for some $\left.Y \in H_{\mathbb{T}}^{*}\left(X_{M}^{\tau} ; R\right) \llbracket \hbar\right\rceil[[\Lambda]]$ with $\left.\llbracket Y(\hbar, Q)\right|_{I} \rrbracket_{Q ; \mathbf{0}} \in$ $R_{\alpha}^{*}$ for all $I \in \mathscr{V}_{M}^{\tau}$, then $Z$ is determined by its ' $\bmod \hbar^{-1}$ part' (see Proposition 5.6);

[^4](M3) $\dot{\mathcal{Y}}_{\mathrm{p}}$ of (4.25) and $\dot{\mathcal{Z}}_{\zeta}$ of (4.2) are $\dot{\mathfrak{C}}$-recursive in the sense of Definition 5.2 with $\dot{\mathfrak{C}}$ given by (5.20), while $\ddot{\mathcal{Y}}_{\text {p }}$ of (4.25) and $\ddot{\mathcal{Z}}_{\zeta}$ of (4.2) are $\ddot{\mathfrak{C}}$-recursive with $\ddot{\mathfrak{C}}$ given by (5.20);
(M4) $\left(\dot{\mathcal{Y}}, \ddot{\mathcal{Y}}_{\mathrm{p}}\right),\left(\ddot{\mathcal{Y}}, \dot{\mathcal{Y}}_{\mathrm{p}}\right),\left(\dot{\mathcal{Z}}_{1}, \ddot{\mathcal{Z}}_{\zeta}\right)$, and $\left(\ddot{\mathcal{Z}}_{1}, \dot{\mathcal{Z}}_{\zeta}\right)$ satisfy the MPC;
(M5) the two sides of (4.24) viewed as powers series in $\hbar^{-1}$, agree $\bmod \hbar^{-1}$.
The proof of Theorem 4.5 described below follows the same ideas and extends the proof of [Z1, (1.17)].

Claims (M3) and (M4) concerning $\dot{\mathcal{Z}}_{\zeta}$ and $\ddot{\mathcal{Z}}_{\zeta}$ follow from Lemmas 5.12 and 5.13, since by the string equation of [MirSym, Section 26.3] and (5.21),

$$
\dot{\mathcal{Z}}_{\zeta}(\hbar, Q)=\hbar \dot{\mathcal{Z}}_{\eta, \beta}(\hbar, Q) \quad \text { and } \quad \ddot{\mathcal{Z}}_{\zeta}(\hbar, Q)=\hbar \ddot{\mathcal{Z}}_{\eta, \beta}(\hbar, Q)
$$

if $m=3, \beta_{2}=\beta_{3}=0, \eta_{2}=\zeta$, and $\eta_{3}=1$.
By Lemmas 5.16, 5.17, and 5.7, $\dot{\mathcal{Y}}$ is $\dot{\mathfrak{C}}$-recursive and $\ddot{\mathcal{Y}}$ is $\ddot{\mathfrak{C}}$-recursive, while $(\dot{\mathcal{Y}}, \ddot{\mathcal{Y}})$ and $(\ddot{\mathcal{Y}}, \dot{\mathcal{Y}})$ satisfy the MPC. This together with the admissibility of transforms $(a)$ and $(b)$ of Lemma 5.8 proves claims (M3) and (M4) for $\dot{\mathcal{Y}}_{\mathrm{p}}$ and $\ddot{\mathcal{Y}}_{\mathrm{p}}$.

Claims (M3) and (M4) together with (5.2), the admissibility of transforms (c) and (d) of Lemma 5.8, and Proposition 5.6, prove that verifying (4.24) amounts to showing that the two sides of each of these equations agree mod $\hbar^{-1}$; this is in turn equivalent to (4.14).

Lemma 5.7, Lemma 5.8, and Proposition 5.6 are proved in Section 5.3 , the preparations for this section and the ones following it are made in Section 5.2. Lemmas 5.12 and 5.13 are proved in Sections 5.5 and 5.6, respectively. Both proofs rely on the Virtual Localization Theorem [GraPa, (1)]. The localization data provided by [Sp] is presented in Section 5.4. Lemmas 5.16 and 5.17 are proved in Section 5.7 .

Proof of (4.34). Define $E_{\mathbf{p}}^{-} \in \mathbb{Z}$ with $\mathbf{p} \in\left(\mathbb{Z}^{\geqslant 0}\right)^{k}$ by

$$
\prod_{i=1}^{b}\left(\sum_{r=1}^{k} \ell_{r i}^{-} \mathrm{A}_{r}\right) \equiv \sum_{\mathbf{p} \in(\mathbb{Z} \geq 0)^{k}} E_{\mathbf{p}}^{-} \mathrm{A}^{\mathbf{p}}
$$

By (4.7) and (4.31),

$$
\begin{equation*}
\mathbf{e}\left(E^{-}\right) \hat{\mathcal{Y}}(x, \hbar, q)=\sum_{\mathbf{p} \in(\mathbb{Z} \geq 0)^{k}} E_{\mathbf{p}}^{-}\left\{x+\hbar q \frac{\mathrm{~d}}{\mathrm{~d} q}\right\}^{\mathbf{p}} \dot{\mathcal{Y}}(x, h, q) \tag{5.3}
\end{equation*}
$$

Since $\dot{\mathcal{Y}}$ is $\dot{\mathfrak{C}}$-recursive by Lemma 5.16 and $(\ddot{\mathcal{Y}}, \dot{\mathcal{Y}})$ satisfies the MPC by Lemmas 5.7 and 5.17 , $\mathbf{e}\left(E^{-}\right) \hat{\mathcal{Y}}$ is $\dot{\mathfrak{C}}$-recursive and $\left(\ddot{\mathcal{Y}}, \mathbf{e}\left(E^{-}\right) \hat{\mathcal{Y}}\right)$ satisfies the MPC by (5.3) and Lemma 5. 5. (a). This together with Lemma $5.8(a)(b)$ implies that the right-hand side of (4.34) is $\dot{\mathfrak{C}}$-recursive and satisfies the MPC with respect to $\ddot{\mathcal{Y}}$. Since $\dot{\mathcal{Y}}_{\mathrm{p}}$ also satisfies these two properties by (M3) and (M4), the claim follows from (M2) and the fact that both sides of (4.34) are congruent to $x^{\mathbf{p}}$ modulo $\hbar^{-1}$. The latter follows from the fact that $\dot{\mathcal{Y}}_{\mathbf{p}}(x, h, Q)$ and $\hat{\mathcal{Y}}_{\mathbf{p}}(x, h, Q)$ are congruent to $x^{\mathbf{p}}$ modulo $\hbar^{-1}$ by (4.14) together with (4.7), (4.32), and (4.33).

Proof of Theorem 4.5. By (4.1), (2.35), and (2.21),

$$
\begin{equation*}
\left.\left(\hbar_{1}+\hbar_{2}\right) \dot{\mathcal{Z}}\left(\hbar_{1}, \hbar_{2}, Q\right)\right|_{[I] \times[J]}=\hbar_{1} \hbar_{2} \sum_{\mathbf{d} \in \Lambda} Q^{\mathbf{d}} \int_{\left[\overline{\mathfrak{M}}_{0,3}\left(X_{M}^{\tau}, \mathrm{d}\right)\right]^{v i r}} \frac{\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right) \mathrm{ev}_{1}^{*} \phi_{I} \mathrm{ev}_{2}^{*} \phi_{J}}{\left(\hbar_{1}-\psi_{1}\right)\left(\hbar_{2}-\psi_{2}\right)} \tag{5.4}
\end{equation*}
$$

for all $I, J \in \mathscr{V}_{M}^{\tau}$. Applying Lemmas 5.12 and 5.13 for $\dot{\mathcal{Z}}_{\eta, \beta}\left(\hbar_{1}, Q\right)$ with

$$
m=3, \quad \beta_{2}=n, \quad \beta_{3}=0, \quad \eta_{2}=\phi_{J}, \quad \eta_{3}=1,
$$

along with Lemma 5.\& (b), we obtain that the coefficient of $\hbar_{2}^{-n}$ in $\left(\hbar_{1}+\hbar_{2}\right) \dot{\mathcal{Z}}\left(\hbar_{1}, \hbar_{2}, Q\right)$ is $\dot{\mathfrak{C}}$-recursive with $\dot{\mathfrak{C}}$ given by (5.20) and satisfies the MPC with respect to $\ddot{\mathcal{Z}}_{1}\left(\hbar_{1}, Q\right)$ for all $n \geqslant 0$. Using this, Proposition 2.21), (M3), (M4), and (M2), it follows that in order to prove (4.23) it suffices to show that

$$
\begin{equation*}
\left.\left.\left.\left(\hbar_{1}+\hbar_{2}\right) \dot{\mathcal{Z}}\left(\hbar_{1}, \hbar_{2}, Q\right)\right|_{[I] \times[J]} \cong \sum_{j=1}^{s} \dot{\mathcal{Z}}_{\eta_{j}}\left(\hbar_{1}, Q\right)\right|_{[I]} \ddot{\mathcal{Z}}_{\eta_{j}}\left(\hbar_{2}, Q\right)\right|_{[J]} \bmod \hbar_{1}^{-1} \tag{5.5}
\end{equation*}
$$

for all $I, J \in \mathscr{V}_{M}^{\tau}$. By (5.4) and the string equation, the left-hand side of (5.5) $\bmod \hbar_{1}^{-1}$ is

$$
\begin{align*}
\phi_{I}(J)+ & \hbar_{2} \sum_{\mathbf{d} \in \Lambda-0} Q^{\mathbf{d}} \int_{\left[\overline{\mathfrak{M}}_{0,3}\left(X_{M}^{\tau}, \mathrm{d}\right)\right]^{v i r}} \frac{\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right) \mathrm{ev}_{1}^{*} \phi_{I} \mathrm{ev}_{2}^{*} \phi_{J}}{\hbar_{2}-\psi_{2}} \\
& =\left.\Delta_{*} 1\right|_{[I] \times[J]}+\sum_{\mathrm{d} \in \Lambda-0} Q^{\mathbf{d}} \int_{\left[\overline{\mathfrak{M}}_{0,2}\left(X_{M}^{\tau}, \mathrm{d}\right)\right]^{v i r}} \frac{\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right) \mathrm{ev}_{1}^{*} \phi_{I} \mathrm{ev}_{2}^{*} \phi_{J}}{\hbar_{2}-\psi_{2}} \tag{5.6}
\end{align*}
$$

where $\Delta: X_{M}^{\tau} \longrightarrow X_{M}^{\tau} \times X_{M}^{\tau}, \Delta[z] \equiv([z],[z])$. The right-hand side of (5.5) $\bmod \hbar_{1}^{-1}$ is

$$
\begin{equation*}
\sum_{j=1}^{s} \eta_{j}\left|\ddot{\mathcal{Z}}_{\breve{\eta}_{j}}\left(\hbar_{2}, Q\right)\right|_{[J]} \tag{5.7}
\end{equation*}
$$

Applying Lemmas 5.12 and 5.13 for $\ddot{\mathcal{Z}}_{\eta, \beta}\left(\hbar_{2}, Q\right)$ with

$$
m=3, \quad \beta_{2}=\beta_{3}=0, \quad \eta_{2}=\phi_{I}, \quad \eta_{3}=1,
$$

along with Lemma $5.8(b)$, we obtain that (5.6) is the restriction to $[J]$ of a $\ddot{\mathfrak{C}}$-recursive formal power series which satisfies the MPC with respect to $\dot{\mathcal{Z}}_{1}\left(\hbar_{2}, Q\right)$. Since (5.7) also satisfies these two properties, by Proposition 5.6 the power series (5.6) and (5.7) agree if and only if they agree $\bmod \hbar_{2}^{-1}$. The latter is the case since (5.7) $\bmod \hbar^{-1}$ is the equivariant Poincaré dual to the diagonal in $X_{M}^{\tau} \times X_{M}^{\tau}$ restricted to the point $[I] \times[J]$.

### 5.2 Notation for fixed points and curves

With $\mathscr{V}_{M}^{\tau}$ as in (2.4) and for all $I, J \in \mathscr{V}_{M}^{\tau}$ with $|I \cap J|=k-1$, we denote by

$$
\begin{equation*}
\overline{I J} \equiv X_{M}^{\tau}(I \cup J) \subseteq X_{M}^{\tau} \quad \text { and } \quad \operatorname{deg} \overline{I J} \equiv[\overline{I J}]_{\left[X_{M}^{\tau}\right]} \in \Lambda \tag{5.8}
\end{equation*}
$$

the $\mathbb{P}^{1}$ passing through the points $[I]$ and $[J]$ and its homology class, respectively; see Corollary 2.20, Given $I \in \mathscr{V}_{M}^{\tau}$ and $j \in[N]-I$, we denote by

$$
\overline{I j} \equiv X_{M}^{\tau}(I \cup\{j\}) \quad \text { and } \quad \operatorname{deg} \overline{I j} \equiv[\overline{I j}]_{\left[X_{M}^{\tau}\right]} \in \Lambda
$$

the compact one-dimensional complex submanifold of $X_{M}^{\tau}$ defined by Remark 2.10 and its homology class, respectively. Since $X_{M}^{\tau}$ admits a Kähler form,

$$
\operatorname{deg} \overline{I J}, \operatorname{deg} \overline{I j} \in \Lambda-\{0\}
$$

by [GriH, Chapter 0, Section 7]. By the last part of Remark [2.10, there exists a unique element $v(I, j)$ of $\mathscr{V}_{M}^{\tau}$ such that

$$
v(I, j) \neq I \text { and } v(I, j) \subset I \cup\{j\} .
$$

Since $v(I, j) \cup I=\{j\} \cup I, j \in v(I, j)$ and $\overline{I j}=\overline{I v(I, j)}$. Let $\{\hat{j}\} \equiv I-v(I, j)$.
Applying the Localization Theorem (2.22) to the integral of 1 over $\overline{I j} \cong \mathbb{P}^{1}$ and using (2.34) and Corollary 2.20, we find that

$$
\begin{equation*}
u_{j}(I)+u_{\hat{j}}(v(I, j))=0 \quad \forall I \in \mathscr{V}_{M}^{\tau}, j \in[N]-I \tag{5.9}
\end{equation*}
$$

Applying the Localization Theorem (2.22) to the integrals of $x_{i}, \lambda_{i}^{ \pm}$, and $u_{s}$ over $\overline{I j}$ and using Corollary 2.20. (2.34), and (5.9), we find that

$$
\begin{array}{rlrl}
x_{i}(I)-x_{i}(v(I, j)) & =\left\langle\mathrm{H}_{i}, \operatorname{deg} \overline{I j}\right\rangle u_{j}(I) & \forall I \in \mathscr{V}_{M}^{\tau}, j \in[N]-I, i \in[k], \\
\lambda_{i}^{ \pm}(I)-\lambda_{i}^{ \pm}(v(I, j)) & =L_{i}^{ \pm}(\overline{I j}) u_{j}(I) & & \forall I \in \mathscr{V}_{M}^{\tau}, j \in[N]-I, i \in[a](i \in[b]), \\
u_{s}(I)-u_{s}(v(I, j)) & =D_{s}(\overline{I j}) u_{j}(I) & & \forall I \in \mathscr{V}_{M}^{\tau}, j \in[N]-I, s \in[N] . \tag{5.12}
\end{array}
$$

By (5.12), (5.9), (2.30), and (2.33),

$$
\begin{equation*}
D_{j}(\overline{I j})=D_{\hat{j}}(\overline{I j})=1, \quad D_{s}(\overline{I j})=0 \quad \forall s \in I \cap v(I, j) \tag{5.13}
\end{equation*}
$$

The last five identities are stated in [Gi2].

### 5.3 Recursivity, polynomiality, and admissible transforms

As in [Gi2], we introduce a partial order on $\Lambda$ : if $\mathbf{s}, \mathbf{d} \in \Lambda$, we define $\mathbf{s} \leq \mathbf{d}$ if $\mathbf{d}-\mathbf{s} \in \Lambda$. By Proposition 2.16,

$$
\begin{equation*}
\mathbf{d} \in \Lambda \quad \Longrightarrow \quad\{\mathbf{s} \in \Lambda: \mathbf{s} \leq \mathbf{d}\} \text { is finite. } \tag{5.14}
\end{equation*}
$$

This implies that for every non-empty subset $S$ of $\Lambda$, there exists $\mathbf{d} \in S$ such that

$$
\mathbf{s} \in \Lambda, \mathbf{s}<\mathbf{d} \quad \Longrightarrow \quad \mathbf{s} \notin S
$$

Definition 5.2. Let $R \supseteq \mathbb{Q}$ be any field and $C \equiv\left(C_{I, j}(d)\right)_{I \in \mathscr{V}_{M}^{\tau}, j \in[N]-I}^{d}$ any collection of elements of $R_{\alpha}$. A power series $Z \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau} ; R\right) \Pi \hbar \Pi[[\Lambda]]$ is $C$-recursive if the following holds: if $\mathbf{d}^{*} \in \Lambda$ is such that

$$
\llbracket Z(x(v(I, j)), \hbar, Q) \rrbracket_{Q ; \mathbf{d}^{*}-d \cdot \operatorname{deg} \overline{I j}} \in R_{\alpha}(\hbar) \quad \forall I \in \mathscr{V}_{M}^{\tau}, j \in[N]-I, d \geqslant 1
$$

and $\llbracket Z(x(v(I, j)), \hbar, Q) \rrbracket_{Q ; \mathbf{d}^{*}-d \cdot d e g \overline{I j}}$ is regular at $\hbar=-u_{j}(I) / d$ for all $I \in \mathscr{V}_{M}^{\tau}, j \in[N]-I$, and $d \geqslant 1$, then

$$
\llbracket Z(x(I), \hbar, Q) \rrbracket_{Q ; \mathbf{d}^{*}}-\left.\sum_{\substack{d \geqslant 1}} \sum_{\substack{j \in[N]-I \\ d \cdot \operatorname{deg} \overline{I j} \leq \mathbf{d}^{*}}} \frac{C_{I, j}(d)}{\hbar+\frac{u_{j}(I)}{d}} \llbracket Z(x(v(I, j)), \hbar, Q) \rrbracket_{Q ; \mathbf{d}^{*}-d \cdot \operatorname{deg} \overline{I j}}\right|_{\hbar=-\frac{u_{j}(I)}{d}} \in R_{\alpha}\left[\hbar, \hbar^{-1}\right],
$$

for all $I \in \mathscr{V}_{M}^{\tau}$. A power series $Z \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau} ; R\right) \Pi \hbar \Pi[[[\Lambda]]$ is called recursive if it is $C$-recursive for some collection $C \equiv\left(C_{I, j}(d)\right)_{I \in \mathscr{V}_{M}^{\tau}, j \in[N]-I}^{d}$ of elements of $R_{\alpha}$.

By Remark 5.3 below, if $\left.Z \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau} ; R\right) \llbracket \hbar\right\rceil[[\Lambda]]$ is $\left(C_{I, j}(d)\right)_{I \in \mathscr{Y}_{M}^{\tau}, j \in[N]-I^{-}}^{\text {-recursive, then }}$ for each $I \in \mathscr{V}_{M}^{\tau}$

$$
\begin{aligned}
Z(x(I), \hbar, Q)= & \sum_{\mathrm{d} \in \Lambda} \sum_{r=-N_{\mathrm{d}}}^{N_{\mathrm{d}}} Z_{I ; \mathrm{d}}^{(r)} \hbar^{-r} Q^{\mathrm{d}} \\
& +\sum_{d=1}^{\infty} \sum_{j \in[N]-I} \frac{C_{I, j}(d) Q^{d \cdot \operatorname{deg} \overline{I j}}}{\hbar+\frac{u_{j}(I)}{d}} Z\left(x(v(I, j)),-\frac{u_{j}(I)}{d}, Q\right)
\end{aligned}
$$

for some integers $N_{\mathbf{d}}$ and some $Z_{I ; \mathbf{d}}^{(r)} \in R_{\alpha}$.
Remark 5.3. Let $R \supseteq \mathbb{Q}$ be any field. If $\left.Z \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau} ; R\right) \llbracket \hbar \Pi\right][[\Lambda]]$ is recursive, then $\left.Z\right|_{I} \in$ $R_{\alpha}(\hbar)[[\Lambda]]$ and $\llbracket Z(x(v(I, j)), \hbar, Q) \rrbracket_{Q ; \mathrm{d}}$ is regular at $\hbar=\frac{-u_{j}(I)}{d}$ for all $I \in \mathscr{V}_{M}^{\tau}, \mathbf{d} \in \Lambda, j \in[N]-I$, and $d \geqslant 1$; this follows by induction on $\mathbf{d} \in \Lambda$. The regularity claim also uses Remark 5.4 below.

The $C$-recursivity is an $R_{\alpha}$-linear property (that is, if $Z_{1}$ and $Z_{2}$ are $C$-recursive, then so is $f_{1} Z_{1}+f_{2} Z_{2}$ for any $f_{1}, f_{2} \in R_{\alpha}$ ). By Lemma 5.8(b), $C$-recursivity is actually an $R_{\alpha}[\hbar][[\Lambda]]-$ linear property.

Remark 5.4. For all $I \in \mathscr{V}_{M}^{\tau}, j \in[N]-I$, all $d \in \mathbb{Q}-\{1\}$, and all $s \in[N]$,

$$
u_{j}(I)+d \cdot u_{s}(v(I, j)) \neq 0
$$

Proof. Assume that

$$
\begin{equation*}
u_{j}(I)+d \cdot u_{s}(v(I, j))=0 \tag{5.15}
\end{equation*}
$$

for some $I \in \mathscr{V}_{M}^{\tau}, j \in[N]-I, d \in \mathbb{Q}-\{1\}$, and $s \in[N]$. If $d=0$ or $s \in v(I, j)$, then $u_{j}(I)=0$ by (2.30) which contradicts (2.33). If $d \neq 0$ and $s \in(I-v(I, j))$, then $u_{j}(I)(1-d)=0$ by (5.15) and (5.9), which again contradicts (2.33). If $d \neq 0$ and $s \notin(I \cup v(I, j))$, then setting $\alpha_{i}=0$ for all $i \in(I \cup v(I, j))$ in (5.15) and using (2.33), we find that $-d \alpha_{s}=0$, which is false.

For the purposes of Definition 5.5 and the transforms $(a)$ and $(d)$ in Lemma 5.8 below as well as all statements involving them, we identify $H_{2}\left(X_{M}^{\tau} ; \mathbb{Z}\right)$ with $\mathbb{Z}^{k}$ via the dual basis to $\left\{\mathrm{H}_{1}, \ldots, \mathrm{H}_{k}\right\}$ so that $\Lambda \subset \mathbb{Z}^{k}$.

Definition 5.5. For any $\left.Y \equiv Y(\hbar, Q), Z \equiv Z(\hbar, Q) \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau} ; R\right) \llbracket \hbar\right\rceil[[\Lambda]]$, define $\Phi_{Y, Z} \in$ $\left.R_{\alpha} \Pi \hbar\right\rceil[[[z, \Lambda]]$ by

$$
\Phi_{Y, Z}(\hbar, z, Q) \equiv \sum_{I \in \mathscr{V}_{M}^{\tau}} \frac{\mathrm{e}^{x(I) \cdot z}}{\prod_{j \in[N]-I} u_{j}(I)} Y\left(x(I), \hbar, Q \mathrm{e}^{\hbar z}\right) Z(x(I),-\hbar, Q),
$$

where $z \equiv\left(z_{1}, \ldots, z_{k}\right), x(I) \cdot z \equiv \sum_{i=1}^{k} x_{i}(I) z_{i}$, and $Q \mathrm{e}^{\hbar z} \equiv\left(Q_{1} \mathrm{e}^{\hbar z_{1}}, \ldots, Q_{k} \mathrm{e}^{\hbar z_{k}}\right)$.
If $\left.Y, Z \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau} ; R\right) \llbracket \hbar\right\rceil[[\Lambda]]$, the pair $(Y, Z)$ satisfies the mutual polynomiality condition (MPC) if $\Phi_{Y, Z} \in R_{\alpha}[\hbar][[z, \Lambda]]$.

Proposition 5.6. Let $R \supseteq \mathbb{Q}$ be a field. Assume that $\left.Z \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau} ; R\right) \llbracket \hbar\right\rceil[[\Lambda]]$ is recursive and that $(Y, Z)$ satisfies the MPC for some $\left.Y \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau} ; R\right) \Pi \hbar\right\rceil[[\Lambda]]$ with

$$
\left.\llbracket Y(\hbar, Q)\right|_{I} \rrbracket_{Q ; \mathbf{0}} \in R_{\alpha}^{*} \quad \forall I \in \mathscr{V}_{M}^{\tau} .
$$

Then, $Z(\hbar, Q) \cong 0 \bmod \hbar^{-1}$ if and only if $Z(\hbar, Q)=0$.
Proof. By the second statement in Proposition 2.21](b),

$$
Z(\hbar, Q)=\left.0 \quad \Longleftrightarrow \quad Z(\hbar, Q)\right|_{I}=0 \quad \forall I \in \mathscr{V}_{M}^{\tau} .
$$

Set $\left.f_{I} \equiv \llbracket Y(-\hbar, Q)\right|_{I} \rrbracket_{Q ; \mathbf{0}}$ and assume that $\left.\llbracket Z(\hbar, Q)\right|_{I} \rrbracket_{Q ; \mathbf{d}^{\prime}}=0$ for all $0 \leq \mathbf{d}^{\prime}<\mathbf{d}$ and all $I \in \mathscr{V}_{M}^{\tau}$. Since $Z$ is recursive and $Z(\hbar, Q) \cong 0$ modulo $\hbar^{-1}$,

$$
\left.\llbracket Z(\hbar, Q)\right|_{I} \rrbracket_{Q ; \mathbf{d}}=\sum_{r=1}^{N_{\mathrm{d}}} Z_{I ; \mathrm{d}}^{(r)} \hbar^{-r}
$$

for some $N_{\mathbf{d}} \geqslant 0$ and some $Z_{I ; \mathbf{d}}^{(r)} \in R_{\alpha}$. Thus,

$$
\llbracket \Phi_{Y, Z}(-\hbar, z, Q) \rrbracket_{Q ; \mathbf{d}}=\sum_{I \in \mathcal{Y}_{M}^{\tau}} \frac{\mathrm{e}^{x(I) \cdot z}}{\prod_{j \in[N]-I} u_{j}(I)} f_{I}\left(\sum_{r=1}^{N_{\mathrm{d}}} Z_{I ; \mathbf{d}}^{(r)} \hbar^{-r}\right) \in R_{\alpha}[\hbar][[z]] .
$$

This implies that

$$
\sum_{I \in \mathscr{Y}_{M}^{\tau}} \frac{(x(I) \cdot z)^{m}}{\prod_{j \in[N]-I} u_{j}(I)} f_{I}\left(\sum_{r=1}^{N_{\mathrm{d}}} Z_{I ; \mathbf{d}}^{(r)} \hbar^{-r}\right) \in R_{\alpha}[\hbar, z] \quad \forall m \geqslant 0 .
$$

In particular,

$$
\sum_{I \in \mathscr{V}_{M}^{\tau}} \frac{(x(I) \cdot z)^{m}}{\prod_{j \in[N]-I} u_{j}(I)} f_{I} Z_{I ; \mathbf{d}}^{(r)}=0 \quad \forall 0 \leqslant m \leqslant\left|\mathscr{V}_{M}^{\tau}\right|-1, \forall r \in\left[N_{\mathbf{d}}\right] .
$$

For each $r \in\left[N_{\mathbf{d}}\right]$, this is a linear system in the 'unknowns' $f_{I} Z_{I ; \mathbf{d}}^{(r)} / \prod_{j \in[N]-I} u_{j}(I)$ with $I \in \mathscr{V}_{M}^{\tau}$. Its coefficient matrix has a non-zero Vandermonde determinant, since

$$
x(I) \neq x(J) \quad \forall I \neq J \in \mathscr{V}_{M}^{\tau}
$$

by Proposition 2.21 (a). It follows that $Z_{I ; \mathbf{d}}^{(r)}=0$ for all $I \in \mathscr{V}_{M}^{\tau}$ and all $r \in\left[N_{\mathbf{d}}\right]$.
Lemmas 5.7 and 5.8 below extend [Z1, Lemmas 2.2, 2.3] from the $X_{M}^{\tau}=\mathbb{P}^{n-1}$ case to an arbitrary $X_{\mathcal{I}}^{\tau}$. Our proof of the former is completely different from and much simpler than the one in [Z1]. For the latter, the arguments in [Z1] go through with only two significant changes required.
Lemma 5.7. Let $R \supseteq \mathbb{Q}$ be a field and $Y, Z \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau} ; R\right) \llbracket \hbar \Pi[[\Lambda]]$. Then,

$$
\Phi_{Y, Z} \in R_{\alpha}[\hbar][[z, \Lambda]] \quad \Longleftrightarrow \quad \Phi_{Z, Y} \in R_{\alpha}[\hbar][[z, \Lambda]] .
$$

Proof. Let $Y_{\mathbf{d}}(\hbar) \equiv \llbracket Y(\hbar, Q) \rrbracket_{Q ; \mathbf{d}}$ and $Z_{\mathbf{d}}(\hbar) \equiv \llbracket Z(\hbar, Q) \rrbracket_{Q ; \mathbf{d}}$. It follows that $\llbracket \Phi_{Y, Z}(\hbar, z, Q) \rrbracket_{Q ; \mathbf{d}}$ is
where $\mathrm{e}^{\hbar z} \equiv\left(\mathrm{e}^{\hbar z_{1}}, \ldots, \mathrm{e}^{\hbar z_{k}}\right)$. The right-hand side is $\mathrm{e}^{\hbar z \mathrm{~d}}$ times $\llbracket \Phi_{Z, Y}(-\hbar, z, Q) \rrbracket_{Q ; \mathbf{d}}$.
Lemma 5.8. Let $R \supseteq \mathbb{Q}$ be any field and $C \equiv\left(C_{I, j}(d)\right)_{I \in \mathscr{V}_{M}^{\tau}}^{d \geqslant 1}, j \in[N]-I \quad$ any collection of elements of $R_{\alpha}$. Let $\left.Y_{1}, Y_{2}, Y_{3} \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau} ; R\right) \Pi \hbar\right\rceil[[\Lambda]]$. If $Y_{1}$ is $C$-recursive and $\left(Y_{2}, Y_{3}\right)$ satisfies the MPC, then
(a) if $\overline{Y_{i}} \equiv\left\{x_{s}+\hbar Q_{s} \frac{\mathrm{~d}}{\mathrm{~d} Q_{s}}\right\} Y_{i}$ for all $i$ and $s \in[k]$, then $\overline{Y_{1}}$ is $C$-recursive and $\Phi_{Y_{2}, \overline{Y_{3}}} \in$ $R_{\alpha}[\hbar][[z, \Lambda]] ;$
(b) if $f \in R_{\alpha}[\hbar][[\Lambda]]$, then $f Y_{1}$ is $C$-recursive and $\Phi_{Y_{2}, f Y_{3}} \in R_{\alpha}[\hbar][[z, \Lambda]]$;
(c) if $f \in R_{\alpha}[[\Lambda-0]]$ and $\overline{Y_{i}} \equiv \mathrm{e}^{f / \hbar} Y_{i}$ for all $i$, then $\overline{Y_{1}}$ is C-recursive and $\Phi_{\overline{Y_{2}}, \overline{Y_{3}}} \in R_{\alpha}[\hbar][[z, \Lambda]]$;
(d) if $f_{r} \in R_{\alpha}[[\Lambda-0]]$ for all $r \in[k]$ and $\bar{Y}_{i}(\hbar, Q) \equiv \mathrm{e}^{f \cdot x / \hbar} Y_{i}\left(\hbar, Q \mathrm{e}^{f}\right)$ for all $i$, where $f \cdot x \equiv$ $\sum_{r=1}^{k} f_{r} x_{r}$ and $Q \mathrm{e}^{f} \equiv\left(Q_{1} \mathrm{e}^{f_{1}}, \ldots, Q_{k} \mathrm{e}^{f_{k}}\right)$, then $\overline{Y_{1}}$ is C-recursive and $\Phi_{\overline{Y_{2}}, \overline{Y_{3}}} \in R_{\alpha}[\hbar][[z, \Lambda]]$.
Proof. For all $I \in \mathscr{V}_{M}^{\tau}$,

$$
\begin{aligned}
& \left\{x_{s}(I)+\hbar Q_{s} \frac{\mathrm{~d}}{\mathrm{~d} Q_{s}}\right\}\left(\frac{C_{I, j}(d)}{\hbar+\frac{u_{j}(I)}{d}} Q^{d \cdot \operatorname{deg} \overline{I j}} Y_{1}\left(x(v(I, j)),-\frac{u_{j}(I)}{d}, Q\right)\right)= \\
& \frac{C_{I, j}(d)}{\hbar+\frac{u_{j}(I)}{d}} Q^{d \cdot \operatorname{deg} \overline{I j}} \overline{Y_{1}}\left(x(v(I, j)),-\frac{u_{j}(I)}{d}, Q\right)+\frac{C_{I, j}(d)}{\hbar+\frac{u_{j}(I)}{d}} Q^{d \cdot \operatorname{deg} \overline{T j}} \\
& \times\left(\left(\hbar+\frac{u_{j}(I)}{d}\right) Q_{s} \frac{\mathrm{~d}}{\mathrm{~d} Q_{s}}+\hbar d \cdot \operatorname{deg}_{s} \overline{I j}+x_{s}(I)-x_{s}(v(I, j))\right) Y_{1}\left(x(v(I, j)),-\frac{u_{j}(I)}{d}, Q\right) .
\end{aligned}
$$

The first claim in (a) now follows from Remark 5.3 and (5.10). The second claim in (a) and the claims in (b) $(d)$ follow similarly to the proof of [Z1, Lemma 2.3] for the $X_{M}^{\tau}=\mathbb{P}^{n-1}$ case, using Lemma 5.7, Remark 5.3, (5.14), and (5.10). Equation (5.10) and property (5.14) are used in the proof of the recursivity claim in $(d)$ when showing that

$$
\frac{1}{\hbar+\frac{u_{j}(I)}{d}}\left(\mathrm{e}^{d f(Q) \cdot \operatorname{deg} \overline{I j}+\frac{f(Q) x(I)}{\hbar}}-\mathrm{e}^{\frac{-f(Q) x(v(I, j)) d}{u_{j}(I)}}\right) \in R_{\alpha}\left[\hbar, \hbar^{-1}\right][[\Lambda]] .
$$

Property (5.14) is also used to show that transforms $(c)$ and $(d)$ preserve $H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau} ; R_{\alpha}\right)\left[\hbar, \hbar^{-1}\right][[\Lambda]]$, that

$$
\frac{\mathrm{e}^{f / \hbar}-\mathrm{e}^{-d f / u_{j}(I)}}{\hbar+\frac{u_{j}(I)}{d}} \in R_{\alpha}\left[\hbar, \hbar^{-1}\right][[\Lambda]], \quad \mathrm{e}^{\frac{f\left(Q \mathrm{e}^{\hbar z)}-f(Q)\right.}{\hbar}} \in R_{\alpha}[\hbar][[z, Q]],
$$

in the case of $(c)$, and that

$$
z_{r}+\frac{f_{r}\left(Q \mathrm{e}^{\hbar z}\right)-f_{r}(Q)}{\hbar} \in R_{\alpha}[\hbar, z][[\Lambda]] \quad \forall r \in[k]
$$

in the case of (d).

### 5.4 Torus action on the moduli space of stable maps

An action of $\mathbb{T}^{N}$ on a smooth projective variety $X$ induces an action on $\overline{\mathfrak{M}}_{0, m}(X, \mathbf{d})$ as in Chapter 4 and an integration along the fiber homomorphism as in Section 2.3. The Virtual Localization Theorem [GraPa, (1)] implies that

$$
\begin{equation*}
\int_{\left[\overline{\mathfrak{M}}_{0, m}(X, \mathbf{d})\right]^{v i r}} \eta=\sum_{F \subseteq \overline{\mathfrak{M}}_{0, m}(X, \mathbf{d})^{\mathbb{T}^{N}}} \int_{[F]^{v i r}} \frac{\eta}{\mathbf{e}\left(N_{F / X}^{v i r}\right)} \in \mathbb{Q}[\alpha] \quad \forall \eta \in H_{\mathbb{T}^{N}}^{*}\left(\overline{\mathfrak{M}}_{0, m}(X, \mathbf{d})\right) \tag{5.16}
\end{equation*}
$$

where the sum runs over the components of the $\mathbb{T}^{N}$ pointwise fixed locus

$$
\overline{\mathfrak{M}}_{0, m}(X, \mathbf{d})^{\mathbb{T}^{N}} \subseteq \overline{\mathfrak{M}}_{0, m}(X, \mathbf{d}) .
$$

This section describes $\overline{\mathfrak{M}}_{0, m}\left(X_{M}^{\tau}, d\right)^{\mathbb{T}^{N}}$, the equivariant Euler class $\mathbf{e}\left(N_{F / X}^{v i r}\right)$ of the virtual normal bundle to each component $F$ of $\overline{\mathfrak{M}}_{0, m}\left(X_{M}^{\tau}, d\right)^{\mathbb{T}^{N}}$, and the restriction of $\mathbf{e}\left(\mathcal{V}_{E}\right)$ to $F$. We follow $[\mathrm{Sp}]$ where the corresponding statements are formulated in the language of fans rather than toric pairs.

If $f:\left(\Sigma, z_{1}, \ldots, z_{m}\right) \longrightarrow X_{M}^{\tau}$ is a $\mathbb{T}^{N}$-fixed stable map, then the images of its marked points, nodes, contracted components, and ramification points are $\mathbb{T}^{N}$-fixed points and so points of the form [I] for some $I \in \mathscr{V}_{M}^{\tau}$ by Corollary 2.2q(a). Each non-contracted component $\Sigma_{e}$ of $\Sigma$ maps to a closed $\mathbb{T}^{N}$-fixed curve which is of the form $\overline{I J}$ for some $I, J \in \mathscr{V}_{M}^{\tau}$ with $|I \cap J|=k-1$ by Corollary 2.2q(b). Since all such curves $\overline{I J}$ are biholomorphic to $\mathbb{P}^{1}$ by Corollary 2.20(b), the map

$$
\left.f\right|_{\Sigma_{e}}: \Sigma_{e} \longrightarrow \overline{I J}
$$

is a degree $\mathfrak{d}(e)$ covering map ramified only over $[I]$ and $[J]$. To each such map we associate a decorated graph as in Definition 5.9 below; the vertices of this graph correspond to the nodes and contracted components of $\Sigma$ or the ramification points of $f$; the edges $e$ correspond to non-contracted components $\Sigma_{e}$ of $\Sigma$, and $\mathfrak{d}(e)$ describes the degree of $\left.f\right|_{\Sigma_{e}}$.

Definition 5.9. A genus 0 m-point decorated graph $\Gamma$ is a collection of vertices $\operatorname{Ver}(\Gamma)$, edges $\operatorname{Edg}(\Gamma)$, and maps

$$
\mathfrak{d}: \operatorname{Edg}(\Gamma) \longrightarrow \mathbb{Z}^{>0}, \quad \mathfrak{p}: \operatorname{Ver}(\Gamma) \longrightarrow \mathscr{V}_{M}^{\tau}, \quad \operatorname{dec}:[m] \longrightarrow \operatorname{Ver}(\Gamma)
$$

satisfying the following properties:

1. the underlying graph $(\operatorname{Ver}(\Gamma), \operatorname{Edg}(\Gamma))$ has no loops;
2. if two vertices v and $\mathrm{v}^{\prime}$ are connected by an edge, then $\left|\mathfrak{p}(\mathrm{v}) \cap \mathfrak{p}\left(\mathrm{v}^{\prime}\right)\right|=k-1$.

Such a decorated graph is said to be of degree $\mathbf{d} \in \Lambda$ if

$$
\sum_{\substack{e \in \operatorname{Edg}(\Gamma) \\ \partial e=\left\{\mathrm{v}, \mathrm{v}^{\prime}\right\}}} \mathfrak{d}(e) \operatorname{deg}\left(\overline{\mathfrak{p}(\mathrm{v}) \mathfrak{p}\left(\mathrm{v}^{\prime}\right)}\right)=\mathbf{d},
$$

where $\partial e \equiv\left\{\mathrm{v}, \mathrm{v}^{\prime}\right\}$ for an edge e joining vertices v and $\mathrm{v}^{\prime}$.
For a decorated graph $\Gamma$ as in Definition 5.9, we denote by $\operatorname{Aut}(\Gamma)$ the group of automorphisms of $(\operatorname{Ver}(\Gamma), \operatorname{Edg}(\Gamma))$. It acts naturally on $\prod_{e \in \operatorname{Edg}(\Gamma)} \mathbb{Z}_{\mathfrak{D}(e)}$; let

$$
A_{\Gamma} \equiv \prod_{e \in \operatorname{Edg}(\Gamma)} \mathbb{Z}_{\mathfrak{O}(e)} \rtimes \operatorname{Aut}(\Gamma)
$$

denote the corresponding semidirect product.
For any $v \in \operatorname{Ver}(\Gamma)$, let

$$
\operatorname{Edg}(\mathrm{v}) \equiv|\{e \in \operatorname{Edg}(\Gamma): \mathrm{v} \in \partial e\}| \quad \text { and } \quad \operatorname{val}(\mathrm{v}) \equiv\left|\operatorname{dec}^{-1}(\mathrm{v})\right|+\operatorname{Edg}(\mathrm{v})
$$

denote the number of edges to which the vertex v belongs and its valence, repectively. A flag $F$ in $\Gamma$ is a pair ( $\mathrm{v}, e)$, where $e$ is an edge and v is a vertex of $e$. For a flag $F=(\mathrm{v}, e)$, let $\operatorname{val}(F) \equiv \operatorname{val}(\mathrm{v})$. For a flag $F=(\mathrm{v}, e)$, let $\omega_{F} \equiv \mathbf{e}\left(T_{f^{-1}(\mathfrak{p}(\mathrm{v}))} \mathbb{P}^{1}\right)$, where $f: \mathbb{P}^{1} \longrightarrow \overline{\mathfrak{p}(\mathrm{v}) \mathfrak{p}\left(\mathrm{v}^{\prime}\right)}$ is the degree $\mathfrak{d}(e)$ cover of $\overline{\mathfrak{p}(\mathrm{v}) \mathfrak{p}\left(\mathrm{v}^{\prime}\right)}$ corresponding to $e, \partial e=\left\{\mathrm{v}, \mathrm{v}^{\prime}\right\}$, and the $\mathbb{T}^{N}$-action on $\mathbb{P}^{1}$ is induced from the action on $X_{M}^{\tau}$ via $f$. If $\{j\} \equiv \mathfrak{p}\left(\mathrm{v}^{\prime}\right)-\mathfrak{p}(\mathrm{v})$,

$$
\begin{equation*}
\omega_{F}=\frac{u_{j}(\mathfrak{p}(\mathrm{v}))}{\mathfrak{d}(e)} \tag{5.17}
\end{equation*}
$$

by (2.34). If v is a vertex that belongs to exactly 2 edges $e_{1}$ and $e_{2}$, then we write $F_{i}(\mathrm{v}) \equiv$ (v, $e_{i}$ ).

Given a decorated graph $\Gamma$ as above, let

$$
\mathfrak{M}_{\Gamma} \equiv \prod_{\mathrm{v} \in \operatorname{Ver}(\Gamma)} \overline{\mathfrak{M}}_{0, \mathrm{val}(\mathrm{v})}
$$

where $\overline{\mathfrak{M}}_{0, m} \equiv$ point, whenever $m \leqslant 2$. For a flag $F=(\mathrm{v}, e)$, let $\psi_{F} \in H_{\mathbb{T}^{N}}^{2}\left(\mathfrak{M}_{\Gamma}\right)$ denote the equivariant Euler class of the universal cotangent line bundle on $\mathfrak{M}_{\Gamma}$ corresponding to $F$ (that is, the pull-back of the $\psi$ class on $\overline{\mathfrak{M}}_{0, \text { val(v) }}$ corresponding to $e$ ).
 image is a component of $\overline{\mathfrak{M}}_{0, m}\left(X_{M}^{\tau} ; \mathbf{d}\right)^{\mathbb{T}^{N}}$ and every such component occurs as the image of such a morphism corresponding to some degree $\mathbf{d}$ decorated graph. With $\prod_{e \in \operatorname{Edg}(\Gamma)} \mathbb{Z}_{\mathfrak{D}(e)}$ acting trivially on $\mathfrak{M}_{\Gamma}$, the induced map

$$
\gamma / A_{\Gamma}: \mathfrak{M}_{\Gamma} / A_{\Gamma} \longrightarrow \overline{\mathfrak{M}}_{0, m}\left(X_{M}^{\tau}, \mathbf{d}\right)
$$

identifies $\mathfrak{M}_{\Gamma} / A_{\Gamma}$ with the corresponding component of $\overline{\mathfrak{M}}_{0, m}\left(X_{M}^{\tau}, \mathbf{d}\right)^{\mathbb{T}^{N}}$.
Proposition 5.11 ([Sp, Theorem 7.8]). Let $\Gamma$ be a degree $\mathbf{d}$ genus 0 m-point decorated graph and $N_{\Gamma}^{\text {vir }}$ the virtual normal bundle to $\gamma: \mathfrak{M}_{\Gamma} \longrightarrow \overline{\mathfrak{M}}_{0, m}\left(X_{M}^{\tau}, \mathbf{d}\right)$. Then,

$$
\begin{aligned}
& \mathbf{e}\left(N_{\Gamma}^{v i r}\right)=\prod_{\substack{\text { flags } F \text { of } \Gamma \\
\text { val }(F) \geqslant 3}}\left(\omega_{F}-\psi_{F}\right) \frac{1}{\prod_{\substack{\mathrm{v} \in \operatorname{Ver}(\Gamma)}}\left[\phi_{\mathfrak{p}(\mathrm{v})}(\mathfrak{p}(\mathrm{v}))\right]^{\operatorname{Edg}(\mathrm{v})-1}} \prod_{\begin{array}{c}
\mathrm{v} \in \operatorname{Ver}(\Gamma) \\
\text { valv) } \\
\operatorname{dec}^{-1}(\mathrm{v})=\varnothing
\end{array}}\left(\omega_{F_{1}(\mathrm{v})}+\omega_{F_{2}(\mathrm{v})}\right) \frac{1}{\prod_{\begin{array}{c}
\text { flags } F \text { of } \Gamma \\
\text { val }(F)=1
\end{array}} \omega_{F}}
\end{aligned}
$$

By (5.9) and (5.12),

$$
\begin{aligned}
& \left.(-1)^{\mathfrak{D}(e)}\left(u_{j}(I)\right)^{2 \mathfrak{D}(e)}\right|_{\substack{I=\mathfrak{p}(\mathrm{v}) \\
\{j\}=\mathfrak{p}\left(\mathrm{v}^{\prime}\right)-I}}=u_{\mathfrak{p}\left(\mathrm{v}^{\prime}\right)-\mathfrak{p}(\mathrm{v})}^{\mathfrak{o}(\boldsymbol{p}(\mathrm{p}))} u_{\mathfrak{p}(\mathrm{v})-\mathfrak{p}\left(\mathrm{v}^{\prime}\right)}^{\mathfrak{D}(e)}\left(\mathfrak{p}\left(\mathrm{v}^{\prime}\right)\right), \\
& u_{r}(I)-\left.\frac{s}{\mathfrak{d}(e)} u_{j}(I)\right|_{\substack{I=\mathfrak{p}(\mathrm{v}) \\
\{j\}=\mathfrak{p}\left(\mathrm{v}^{\prime}\right)-I}}= \begin{cases}\frac{\left[\mathfrak{d}(e) D_{r}\left(\overline{\mathfrak{p}(\mathrm{v}) \mathfrak{p}\left(\mathrm{v}^{\prime}\right)}\right)-s\right] u_{r}(\mathfrak{p}(\mathrm{v}))+s u_{r}\left(\mathfrak{p}\left(\mathrm{v}^{\prime}\right)\right)}{\mathfrak{d}(e) D_{r}\left(\overline{\mathfrak{p}(\mathrm{v}) \mathfrak{p}\left(\mathrm{v}^{\prime}\right)}\right)} & \text { if } \quad D_{r}\left(\overline{\mathfrak{p}(\mathrm{v}) \mathfrak{p}\left(\mathrm{v}^{\prime}\right)}\right) \neq 0, \\
u_{r}(\mathfrak{p}(\mathrm{v}))=u_{r}\left(\mathfrak{p}\left(\mathrm{v}^{\prime}\right)\right) & \text { if } \quad D_{r}\left(\overline{\mathfrak{p}(\mathrm{v}) \mathfrak{p}\left(\mathrm{v}^{\prime}\right)}\right), s=0 ;\end{cases}
\end{aligned}
$$

so the edge contributions to $\mathbf{e}\left(N_{\Gamma}^{v i r}\right)$ in Proposition5.11 are indeed symmetric in the vertices of each edge.

Let $f:\left(\mathbb{P}^{1}, z_{1}, \ldots, z_{m}\right) \longrightarrow \overline{I J}$ be a $\mathbb{T}^{N}$-fixed stable map. Thus, $f$ is a degree $d$ cover of $\overline{I J}$ for some $d \in \mathbb{Z}^{>0}$. By (1.1),

$$
\left.\mathcal{V}_{E}\right|_{\left.\mathbb{P}^{1}, z_{1}, \ldots, z_{m}, f\right]}=H^{0}\left(\mathbb{P}^{1}, f^{*} E^{+}\right) \oplus H^{1}\left(\mathbb{P}^{1}, f^{*} E^{-}\right)
$$

By (MirSym, Exercise 27.2.3] together with (5.9) and (5.11), and with $\{j\} \equiv J-I$,

$$
\begin{equation*}
\left.\mathbf{e}\left(\mathcal{V}_{E}\right)\right|_{\left[\mathbb{P}^{1}, z_{1}, \ldots, z_{m}, f\right]}=\prod_{i=1}^{a} \prod_{s=0}^{d L_{i}^{+}(\overline{I J})}\left[\lambda_{i}^{+}(I)-\frac{s}{d} u_{j}(I)\right] \prod_{i=1}^{b} \prod_{s=d L_{i}^{-}(\overline{I J})+1}^{-1}\left[\lambda_{i}^{-}(I)-\frac{s}{d} u_{j}(I)\right] . \tag{5.18}
\end{equation*}
$$

By (5.11),

$$
\begin{aligned}
& \lambda_{i}^{+}(I)-\frac{s}{d} u_{J-I}(I)=\left\{\begin{array}{lll}
\frac{\left[d L_{i}^{+}(\overline{I J})-s\right] \lambda_{i}^{+}(I)+s \lambda_{i}^{+}(J)}{d L_{i}^{+}(\overline{I J})} & \text { if } & L_{i}^{+}(\overline{I J}) \neq 0, \\
\lambda_{i}^{+}(I)=\lambda_{i}^{+}(J) & \text { if } & L_{i}^{+}(\overline{I J})=s=0,
\end{array}\right. \\
& \lambda_{i}^{-}(I)-\frac{s}{d} u_{J-I}(I)=\frac{\left[d L_{i}^{-}(\overline{I J})-s\right] \lambda_{i}^{-}(I)+s \lambda_{i}^{-}(J)}{d L_{i}^{-}(\overline{I J})} .
\end{aligned}
$$

### 5.5 Recursivity for the GW power series

For all $d \in \mathbb{Z}^{>0}, I \in \mathscr{V}_{M}^{\tau}, j \in[N]-I$, let

$$
\begin{align*}
& \widetilde{\mathfrak{C}}_{I, j}(d) \equiv \frac{(-1)^{d} d^{2 d-1}}{(d!)^{2}} \frac{1}{\left[u_{j}(I)\right]^{2 d-1}} \prod_{r \in[N]-(I \cup\{j\})} \frac{\prod_{s=d D_{r}(\bar{J})+1}^{0}}{d D_{r}(\overline{I j})}\left[u_{r}(I)-\frac{s}{d} u_{j}(I)\right]  \tag{5.19}\\
& \prod_{s=1}\left[u_{r}(I)-\frac{s}{d} u_{j}(I)\right]
\end{align*} \in \mathbb{Q}_{\alpha},
$$

Lemma 5.12. If $m \geqslant 3$, $\mathrm{ev}_{j}: \overline{\mathfrak{M}}_{0, m}\left(X_{M}^{\tau}, \mathbf{d}\right) \longrightarrow X_{M}^{\tau}$ is the evaluation map at the $j$-th marked point, $\eta_{j} \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right)$ and $\beta_{j} \in \mathbb{Z} \geqslant 0$ for $j=2, \ldots, m$, then the power series

$$
\begin{align*}
& \dot{\mathcal{Z}}_{\eta, \beta}(\hbar, Q) \equiv \sum_{\mathbf{d} \in \Lambda} Q^{\mathrm{d}} \mathrm{ev}_{1 *}\left[\frac{\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right)}{\hbar-\psi_{1}} \prod_{j=2}^{m}\left(\psi_{j}^{\beta_{j}} \mathrm{ev}_{j}^{*} \eta_{j}\right)\right] \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right) \Pi \hbar \Pi[[\Lambda]] \quad \text { and } \\
& \ddot{\mathcal{Z}}_{\eta, \beta}(\hbar, Q) \equiv \sum_{\mathbf{d} \in \Lambda} Q^{\mathbf{d}} \mathrm{ev}_{1 *}\left[\frac{\mathbf{e}\left(\ddot{\mathcal{V}}_{E}\right)}{\hbar-\psi_{1}} \prod_{j=2}^{m}\left(\psi_{j}^{\beta_{j}} \mathrm{ev}_{j}^{*} \eta_{j}\right)\right] \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right) \Pi \hbar \Pi[[\Lambda]] \tag{5.21}
\end{align*}
$$

are $\dot{\mathfrak{C}}$ - and $\ddot{\mathfrak{C}}$-recursive, respectively, with $\dot{\mathfrak{C}}$ and $\ddot{\mathfrak{C}}$ given by (5.20).
Proof. This is obtained by applying the Virtual Localization Theorem (5.16) on $\overline{\mathfrak{M}}_{0, m}\left(X_{M}^{\tau}, \mathbf{d}\right)$, using Section 5.4, and extending the proof of [Z1, Lemma 1.1] from the case of a positive line bundle over $\mathbb{P}^{n-1}$ to that of a split vector bundle $E=E^{+} \oplus E^{-}$as in (1.5) over an arbitrary symplectic toric manifold $X_{M}^{\tau}$. By (2.35), (2.21), (5.16), and the second equation in (2.34), a decorated graph may contribute to $\dot{\mathcal{Z}}_{\eta, \beta}(\hbar, Q)(I)$ and $\ddot{\mathcal{Z}}_{\eta, \beta}(\hbar, Q)(I)$ only if $\mathfrak{p}(\operatorname{dec}(1))=I$. There are thus two types of contributing graphs: the $A_{I}$ and the $B_{I}$ graphs, where $I \in \mathscr{V}_{M}^{\tau}$. In an $A_{I}$ graph the first marked point is attached to a vertex $\mathrm{v}_{0}$ of valence 2, while in a $B_{I}$ graph the first marked point is attached to a vertex $\mathrm{v}_{0}$ of valence at least 3 . If $\Gamma$ is a $B_{I}$ graph and $\mathcal{Z}_{\Gamma}$ the corresponding component of $\overline{\mathfrak{M}}_{0, m}\left(X_{M}^{\tau}, \mathbf{d}\right)^{\mathbb{T}^{N}}$, then

$$
\psi_{1}^{n}=0 \quad \forall n>\operatorname{val}\left(\mathrm{v}_{0}\right)-3 .
$$

Thus, $\Gamma$ contributes a polynomial in $\hbar^{-1}$ to the coefficient of $Q^{\text {d }}$ in $\dot{\mathcal{Z}}_{\eta, \beta}(\hbar, Q)(I)$ and $\ddot{\mathcal{Z}}_{\eta, \beta}(\hbar, Q)(I)$.

In an $A_{I}$ graph there is a unique vertex v joined to $\mathrm{v}_{0}$ by an edge. Let $A_{(I, j)}\left(d_{0}\right)$ be the set of all $A_{I}$ graphs such that $\mathfrak{p}(\mathrm{v})=v(I, j)$ and the edge having $\mathrm{v}_{0}$ as a vertex is labeled $d_{0}$. Thus,

$$
A_{I}=\bigcup_{d_{0}=1}^{\infty} \bigcup_{j \neq I} A_{(I, j)}\left(d_{0}\right)
$$

Figure 5.1: A graph of type $A_{(I, j)}\left(d_{0}\right)$ and its two subgraphs

We fix $\Gamma \in A_{(I, j)}\left(d_{0}\right)$ and denote by $\Gamma_{0}$ and $\Gamma_{c}$ the two graphs obtained by breaking $\Gamma$ at v , adding a second marked point to the vertex v in $\Gamma_{0}$ and a first marked point to v in $\Gamma_{c}$, and requiring that marked points $2, \ldots, m$ are in $\Gamma_{c}$; see Figure 5.1$]^{8}$ Thus, $\Gamma_{0}$ consists only of the vertices $\mathrm{v}_{0}$ and v and the marked points 1 and 2 attached to $\mathrm{v}_{0}$ and v , respectively. With $\mathcal{Z}_{\Gamma}$ denoting the component in $\overline{\mathfrak{M}}_{0, m}\left(X_{M}^{\tau}, \mathbf{d}\right)^{\mathbb{T}^{N}}$ corresponding to $\Gamma$,

$$
\mathcal{Z}_{\Gamma} \cong \mathcal{Z}_{\Gamma_{0}} \times \mathcal{Z}_{\Gamma_{c}} ;
$$

we denote by $\pi_{0}$ and $\pi_{c}$ the two projections. Thus,

$$
\begin{equation*}
\dot{\mathcal{V}}_{E}=\pi_{0}^{*} \dot{\mathcal{V}}_{E} \oplus \pi_{c}^{*} \dot{\mathcal{V}}_{E} \quad \text { and } \quad \ddot{\mathcal{V}}_{E}=\pi_{0}^{*} \ddot{\mathcal{V}}_{E} \oplus \pi_{c}^{*} \ddot{\mathcal{V}}_{E} \tag{5.22}
\end{equation*}
$$

These identities are obtained by considering the short exact sequence of sheaves

$$
\left.0 \longrightarrow f^{*} E^{ \pm} \longrightarrow f_{0}^{*} E^{ \pm} \oplus f_{c}^{*} E^{ \pm} \longrightarrow E^{ \pm}\right|_{p} \longrightarrow 0
$$

where $f: \Sigma \longrightarrow X_{M}^{\tau}$ is a $\mathbb{T}^{N}$-fixed stable map whose corresponding graph is $\Gamma$, while $f_{0}$ and $f_{c}$ are its restrictions to the components of $\Sigma$ corresponding to the edge leaving $\mathrm{v}_{0}$ and the rest of $\Gamma$. Let

$$
\eta^{\beta} \equiv \prod_{j=2}^{m}\left(\psi_{j}^{\beta_{j}} \operatorname{ev}_{j}^{*} \eta_{j}\right)
$$

By (5.22),

$$
\begin{align*}
& \left.\frac{\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right) \eta^{\beta}}{\hbar-\psi_{1}}\right|_{\mathcal{Z}_{\Gamma}}=\pi_{0}^{*}\left(\frac{\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right)}{\hbar-\psi_{1}}\right) \pi_{c}^{*}\left(\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right) \eta^{\beta}\right), \\
& \left.\frac{\mathbf{e}\left(\ddot{\mathcal{V}}_{E}\right) \eta^{\beta}}{\hbar-\psi_{1}}\right|_{\mathcal{Z}_{\Gamma}}=\pi_{0}^{*}\left(\frac{\mathbf{e}\left(\ddot{\mathcal{V}}_{E}\right)}{\hbar-\psi_{1}}\right) \pi_{c}^{*}\left(\mathbf{e}\left(\ddot{\mathcal{V}}_{E}\right) \eta^{\beta}\right) . \tag{5.23}
\end{align*}
$$

By Proposition 5.11, (5.17), and (5.9),

$$
\begin{equation*}
\frac{\left.\mathrm{ev}_{1}^{*} \phi_{I}\right|_{\mathcal{Z}_{\Gamma}}}{\mathbf{e}\left(N_{\Gamma}^{v i r}\right)}=\pi_{0}^{*}\left(\frac{\mathrm{ev}_{1}^{*} \phi_{I}}{\mathbf{e}\left(N_{\Gamma_{0}}^{v i r}\right)}\right) \pi_{c}^{*}\left(\frac{\mathrm{ev}_{1}^{*} \phi_{v(I, j)}}{\mathbf{e}\left(N_{\Gamma_{c}}^{v i r}\right)}\right) \frac{1}{-\frac{u_{j}(I)}{d_{0}}-\pi_{c}^{*} \psi_{1}} . \tag{5.24}
\end{equation*}
$$

[^5]By (5.18) and (5.11), on $\mathcal{Z}_{\Gamma_{0}}$

$$
\begin{align*}
& \mathbf{e}\left(\dot{\mathcal{V}}_{E}\right)=\prod_{i=1}^{a} \prod_{s=1}^{d_{0} L_{i}^{+}(\overline{I J})}\left[\lambda_{i}^{+}(I)-\frac{s}{d_{0}} u_{j}(I)\right] \prod_{i=1}^{b} \prod_{s=0}^{-d_{0} L_{i}^{-}(\overline{I j})-1}\left[\lambda_{i}^{-}(I)+\frac{s}{d_{0}} u_{j}(I)\right], \\
& \mathbf{e}\left(\ddot{\mathcal{V}}_{E}\right)=\prod_{i=1}^{a} \prod_{s=0}^{d_{0} L_{i}^{+}(\overline{I j})-1}\left[\lambda_{i}^{+}(I)-\frac{s}{d_{0}} u_{j}(I)\right] \prod_{i=1}^{b} \prod_{s=1}^{-d_{0} L_{i}^{-}(\overline{I j})}\left[\lambda_{i}^{-}(I)+\frac{s}{d_{0}} u_{j}(I)\right] . \tag{5.25}
\end{align*}
$$

By Proposition 5.11,

$$
\begin{equation*}
\mathbf{e}\left(N_{\Gamma_{0}}^{v i r}\right)=\frac{(-1)^{d_{0}}\left(d_{0}!\right)^{2}}{d_{0}^{2 d_{0}}}\left[u_{j}(I)\right]^{2 d_{0}} \prod_{r \in[N]-(I \cup\{j\})} \frac{\prod_{s=0}^{s=d_{0} D_{r}(\overline{I j})+1}}{\prod_{s}^{-1}}\left[u_{r}(I)-\frac{s}{d_{0}} u_{j}(I)\right] . \tag{5.26}
\end{equation*}
$$

By (5.25), (5.26), (5.17), and (5.20),

$$
\begin{equation*}
\int_{\mathcal{Z}_{\Gamma_{0}}} \frac{\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right) \mathrm{ev}_{1}^{*} \phi_{I}}{\left(\hbar-\psi_{1}\right) \mathbf{e}\left(N_{\Gamma_{0}}^{v i r}\right)}=\frac{\dot{\mathfrak{C}}_{I, j}\left(d_{0}\right)}{\hbar+\frac{u_{j}(I)}{d_{0}}} \quad \text { and } \quad \int_{\mathcal{Z}_{\Gamma_{0}}} \frac{\mathbf{e}\left(\ddot{\mathcal{V}}_{E}\right) \mathrm{ev}_{1}^{*} \phi_{I}}{\left(\hbar-\psi_{1}\right) \mathbf{e}\left(N_{\Gamma_{0}}^{v i r}\right)}=\frac{\ddot{\mathfrak{C}}_{I, j}\left(d_{0}\right)}{\hbar+\frac{u_{j}(I)}{d_{0}}} \tag{5.27}
\end{equation*}
$$

By (5.23), (5.24), and (5.27),

$$
\begin{align*}
& \left.\int_{\mathcal{Z}_{\Gamma}} \frac{\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right) \mathrm{ev}_{1}^{*} \phi_{I} \eta^{\beta}}{\hbar-\psi_{1}}\right|_{\mathcal{Z}_{\Gamma}} \frac{1}{\mathbf{e}\left(N_{\Gamma}^{v i r}\right)}=\left.\frac{\dot{\mathfrak{C}}_{I, j}\left(d_{0}\right)}{\hbar+\frac{u_{j}(I)}{d_{0}}} \int_{\mathcal{Z}_{\Gamma_{c}}} \frac{\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right) \mathrm{ev}_{1}^{*} \phi_{v(I, j)} \eta^{\beta}}{\hbar-\psi_{1}} \frac{1}{\mathbf{e}\left(N_{\Gamma_{c}}^{v i r}\right)}\right|_{\hbar=-\frac{u_{j}(I)}{d_{0}}},  \tag{5.28}\\
& \left.\int_{\mathcal{Z}_{\Gamma}} \frac{\mathbf{e}\left(\ddot{\mathcal{V}}_{E}\right) \mathrm{ev}_{1}^{*} \phi_{I} \eta^{\beta}}{\hbar-\psi_{1}}\right|_{\mathcal{Z}_{\Gamma}} \frac{1}{\mathbf{e}\left(N_{\Gamma}^{v i r}\right)}=\left.\frac{\ddot{\mathfrak{C}}_{I, j}\left(d_{0}\right)}{\hbar+\frac{u_{j}(I)}{d_{0}}} \int_{\mathcal{Z}_{\Gamma_{c}}} \frac{\mathbf{e}\left(\ddot{\mathcal{V}}_{E}\right) \mathrm{ev}_{1}^{*} \phi_{v(I, j)} \eta^{\beta}}{\hbar-\psi_{1}} \frac{1}{\mathbf{e}\left(N_{\Gamma_{c}}^{v i r}\right)}\right|_{\hbar=-\frac{u_{j}(I)}{d_{0}}} .
\end{align*}
$$

By the first equation in (5.28) and the Virtual Localization Theorem (5.16), the contribution of the $A_{I}$ graphs to the coefficient of $Q^{\mathrm{d}}$ in $\left.\dot{\mathcal{Z}}_{\eta, \beta}\right|_{I}$ is

$$
\left.\sum_{d_{0} \geqslant 1} \sum_{\substack{j \in[N]-I \\ d_{0} \cdot \operatorname{deg} \bar{J} \leq \mathbf{d}}} \frac{\dot{\mathfrak{C}}_{I, j}\left(d_{0}\right)}{\hbar+\frac{u_{j}(I)}{d_{0}}} \llbracket \dot{\mathcal{Z}}_{\eta, \beta}(x(v(I, j)), \hbar, Q) \rrbracket_{Q ; \mathbf{d}-d_{0} \cdot \operatorname{deg} \overline{I j}}\right|_{\hbar=-\frac{u_{j}(I)}{d_{0}}}
$$

whenever $\mathbf{d} \equiv \mathbf{d}^{*}$ satisfies the two properties in Definition 5.2 (which make evaluation at $\hbar=-\frac{u_{j}(I)}{d}$ meaningful). An analogous statement holds when summing in the second equation in (5.28).

### 5.6 MPC for the GW power series

Let $\dot{\mathcal{Z}}_{1}$ and $\ddot{\mathcal{Z}}_{1}$ be as in (4.2) and $\dot{\mathcal{Z}}_{\eta, \beta}$ and $\ddot{\mathcal{Z}}_{\eta, \beta}$ be as in (5.21).

Figure 5.2: A graph representing a fixed locus in $\mathfrak{X}_{\mathbf{d}}\left(X_{M}^{\tau}\right) ; I, J, K, L \in \mathscr{V}_{M}^{\tau}, I \neq J, K, L$.
Lemma 5.13. For all $m \geqslant 3, \eta_{j} \in H_{\mathbb{T}^{N}}^{*}\left(X_{M}^{\tau}\right), \beta_{j} \in \mathbb{Z}^{\geqslant 0}$, the pairs $\left(\ddot{\mathcal{Z}}_{1}(\hbar, Q), \hbar^{m-2} \dot{\mathcal{Z}}_{\eta, \beta}(\hbar, Q)\right)$ and $\left(\dot{\mathcal{Z}}_{1}(\hbar, Q), \hbar^{m-2} \ddot{\mathcal{Z}}_{\eta, \beta}(\hbar, Q)\right)$ satisfy the MPC.

Lemma 5.13 extends [Z1, Lemma 1.2] from the case of a positive line bundle over $\mathbb{P}^{n-1}$ to that of a split vector bundle $E=E^{+} \oplus E^{-}$as in (1.5) over an arbitrary symplectic toric manifold $X_{M}^{\tau}$. While [Z1, Lemma 1.2] follows from [Z1, Lemma 3.1], Lemma 5.13 follows from Lemma 5.15 below, which extends [Z1, Lemma 3.1] to the general toric case. The proof of Lemma 5.15 uses the Virtual Localization Theorem (5.16) instead of the classical one used in the $X_{M}^{\tau}=\mathbb{P}^{n-1}$ case and Lemma 5.14, which is a general toric version of the first displayed formula in [Z1] after [Z1, (3.32)].

As in [Gi1] and [Z1], we consider the action of $\mathbb{T}^{1}$ on $V \equiv \mathbb{C}^{2}$ given by $\xi \cdot\left(z_{0}, z_{1}\right) \equiv\left(z_{0}, \xi^{-1} z_{1}\right)$ and the induced action on $\mathbb{P} V$. Let $\hbar$ be the weight of the standard action of $\mathbb{T}^{1}$ on $\mathbb{C}$. For any $\mathbf{d} \in \Lambda$, let

$$
\mathfrak{X}_{\mathbf{d}}\left(X_{M}^{\tau}\right) \equiv\left\{f \in \overline{\mathfrak{M}}_{0, m}\left(\mathbb{P} V \times X_{M}^{\tau},(1, \mathbf{d})\right): \operatorname{ev}_{1}(f) \in[1,0] \times X_{M}^{\tau}, \mathrm{ev}_{2}(f) \in[0,1] \times X_{M}^{\tau}\right\} .
$$

By Proposition 5.10, the components of the fixed locus $\mathfrak{X}_{\mathbf{d}}\left(X_{M}^{\tau}\right)^{\mathbb{T}^{1} \times \mathbb{T}^{N}}$ of the $\mathbb{T}^{1} \times \mathbb{T}^{N}$. action on $\mathfrak{X}_{\mathbf{d}}\left(X_{M}^{\tau}\right)$ are indexed by decorated graphs $\Gamma$ of the following form. Such a graph $\Gamma$ has a unique edge of positive $\mathbb{P} V$-degree; this special edge corresponds to a degree-one map $f: \mathbb{P}^{1} \longrightarrow \mathbb{P} V \times[I]$ for some $I \in \mathscr{V}_{M}^{\tau}$. Edges to the left (respectively right) of this edge are mapped into $[1,0] \times X_{M}^{\tau}$ (respectively $[0,1] \times X_{M}^{\tau}$ ); see Figure 5.2, where we dropped the $\mathbb{P} V$-label of the vertices ${ }^{9}$ Thus, the first marked point is attached to some vertex to the left of the special edge, while the second marked point is attached to some vertex to the right of the special edge.

Let

$$
\mathbf{d}_{L} \equiv \mathbf{d}_{L}(\Gamma), \quad \mathbf{d}_{R} \equiv \mathbf{d}_{R}(\Gamma) \in \Lambda
$$

denote the $X_{M}^{\tau}$-degrees of the left- and right-hand side (with respect to the special edge) sub-graphs, respectively; thus, $\mathbf{d}=\mathbf{d}_{L}+\mathbf{d}_{R}$. Let $\mathcal{Z}_{\Gamma}$ be the component of $\mathfrak{X}_{\mathbf{d}}\left(X_{M}^{\tau}\right)^{\mathbb{T}^{1} \times \mathbb{T}^{N}}$ corresponding to $\Gamma$.

Lemma 5.14. For every $i \in[k]$ and $\mathbf{d} \in \Lambda$, there exists

$$
\Omega_{i} \in H_{\mathbb{T}^{1} \times \mathbb{T}^{N}}^{2}\left(\mathfrak{X}_{\mathbf{d}}\left(X_{M}^{\tau}\right)\right) \quad \text { such that }\left.\quad \Omega_{i}\right|_{\mathcal{Z}_{\Gamma}}=x_{i}(I)+\left(\mathbf{d}_{L}(\Gamma)\right)_{i} \hbar
$$

for all graphs $\Gamma$ corresponding to components of $\mathfrak{X}_{\mathbf{d}}\left(X_{M}^{\tau}\right){ }^{\mathbb{T}^{1} \times \mathbb{T}^{N}}$, with $\mathbf{d}_{L}(\Gamma)$ and I depending on $\Gamma$ as above.

[^6]Proof. We follow the proof in [Gi1, Section 11] and [Gi2, Section 2].
Given $s \in \mathbb{Z}^{\geqslant 0}$ and $n \geqslant 1$, let

$$
\text { Poly }_{s}^{n} \equiv \mathbb{P}\left(\left\{P \in \mathbb{C}\left[z_{0}, z_{1}\right]: P \text { homogeneous of degree } s\right\}^{\oplus n}\right) .
$$

We next define a morphism

$$
\theta_{0}: \overline{\mathfrak{M}}_{0,0}\left(\mathbb{P} V \times \mathbb{P}^{n-1},(1, s)\right) \longrightarrow \text { Poly }_{s}^{n}
$$

If $[\Sigma, f]$ is an element of $\overline{\mathfrak{M}}_{0,0}\left(\mathbb{P} V \times \mathbb{P}^{n-1},(1, s)\right), \Sigma=\Sigma_{0} \cup \Sigma_{1} \cup \ldots \cup \Sigma_{r}$, where $\Sigma_{0}$ is a $\mathbb{P}^{1}$, $\left.f\right|_{\Sigma_{0}}$ has degree $\left(1, s_{0}\right), \Sigma_{i}$ is connected for all $i \in[r]$, and $\left.f\right|_{\Sigma_{i}}$ has degree $\left(0, s_{i}\right)$ for all $i \in[r]$. Thus,

$$
f\left(\Sigma_{i}\right) \subseteq\left\{\left[A_{i}, B_{i}\right]\right\} \times \mathbb{P}^{n-1} \quad \text { for some } \quad\left[A_{i}, B_{i}\right] \in \mathbb{P} V \quad \forall i \in[r] .
$$

Let $\theta_{0}[\Sigma, f] \equiv\left[P_{1} g, \ldots, P_{n} g\right]$, where

$$
\left.f\right|_{\Sigma_{0}} \equiv\left(f_{1}, f_{2}\right), \quad f_{2} \circ f_{1}^{-1} \equiv\left[P_{1}, \ldots, P_{n}\right] \in \operatorname{Poly}_{s_{0}}^{n}, \quad g \equiv \prod_{i=1}^{r}\left(A_{i} z_{1}-B_{i} z_{0}\right)^{s_{i}} .
$$

Let $\theta \equiv \theta_{0} \circ$ fgt, where

$$
\text { fgt }: \overline{\mathfrak{M}}_{0, m}\left(\mathbb{P} V \times \mathbb{P}^{n-1},(1, s)\right) \longrightarrow \overline{\mathfrak{M}}_{0,0}\left(\mathbb{P} V \times \mathbb{P}^{n-1},(1, s)\right)
$$

is the forgetful morphism. By [Gi1, Section 11, Main Lemma], $\left.\theta\right|_{\mathfrak{X}_{s}\left(\mathbb{P}^{n-1)}\right.}$ is continuous.
The torus $\mathbb{T}^{1} \times \mathbb{T}^{n}$ acts on Poly ${ }_{s}^{n}$ by

$$
\left(\xi, t_{1}, \ldots, t_{n}\right) \cdot\left(P_{1}\left[z_{0}, z_{1}\right], \ldots, P_{n}\left[z_{0}, z_{1}\right]\right) \equiv\left(t_{1} P_{1}\left[z_{0}, \xi z_{1}\right], \ldots, t_{n} P_{n}\left[z_{0}, \xi z_{1}\right]\right)
$$

This action naturally lifts to the hyperplane line bundle over Poly ${ }_{s}^{n}$. The map $\theta_{0}$ is $\mathbb{T}^{1} \times \mathbb{T}^{n}$ equivariant and hence so is $\theta$.

Let $\mathcal{L} \longrightarrow X_{M}^{\tau}$ be any very ample line bundle. For any $\mathbf{d} \in \Lambda$, let $\mathcal{L}(\mathbf{d}) \equiv\left\langle c_{1}(\mathcal{L}), \mathbf{d}\right\rangle$. Consider the canonical lift of the $\mathbb{T}^{N}$-action on $X_{M}^{\tau}$ to $\mathcal{L}$ given by Proposition 2.17 together with (2.23). Thus, there exists $n$, an injective group homomorphism $\iota_{\mathbb{T}}: \mathbb{T}^{N} \longrightarrow \mathbb{T}^{n}$, and an $\iota_{\mathbb{T}}$-equivariant embedding $\iota: X_{M}^{\tau} \longrightarrow \mathbb{P}^{n-1}$ such that $\iota^{*} \mathcal{O}_{\mathbb{P}^{n-1}}(1)=\mathcal{L}$. We consider the $\mathbb{T}^{N}$-action on $\mathbb{P}^{n-1}$ induced by $\iota_{\mathbb{T}}$. The embedding $\iota$ induces a $\mathbb{T}^{1} \times \mathbb{T}^{N}$-equivariant embedding

$$
\mathfrak{X}_{\mathbf{d}}\left(X_{M}^{\tau}\right) \xrightarrow{F} \mathfrak{X}_{\mathcal{L}(\mathbf{d})}\left(\mathbb{P}^{n-1}\right) .
$$

The composition

$$
\mathfrak{X}_{\mathbf{d}}\left(X_{M}^{\tau}\right) \xrightarrow{F} \mathfrak{X}_{\mathcal{L}(\mathbf{d})}\left(\mathbb{P}^{n-1}\right) \xrightarrow{\theta} \operatorname{Poly}_{\mathcal{L}(\mathbf{d})}^{n}
$$

maps $\mathcal{Z}_{\Gamma}$ onto $\left[z_{0}^{\mathcal{L}\left(\mathbf{d}_{R}\right)} z_{1}^{\mathcal{L}\left(\mathbf{d}_{L}\right)} a_{1}, \ldots, z_{0}^{\mathcal{L}\left(\mathbf{d}_{R}\right)} z_{1}^{\mathcal{L}\left(\mathbf{d}_{L}\right)} a_{n}\right]$, where $\left[a_{1}, \ldots, a_{n}\right] \equiv \iota([I])$.
Let $\Omega \in H_{\mathbb{T}^{1} \times \mathbb{T}^{N}}^{2}\left(\operatorname{Poly}_{\mathcal{L}(\mathbf{d})}^{n}\right)$ be the equivariant Euler class of the hyperplane line bundle and

$$
\Omega(\mathcal{L}) \equiv F^{*} \theta^{*} \Omega \in H_{\mathbb{T}^{1} \times \mathbb{T}^{N}}^{2}\left(\mathfrak{X}_{\mathbf{d}}\left(X_{M}^{\tau}\right)\right) .
$$

It follows that

$$
\begin{equation*}
\left.\Omega(\mathcal{L})\right|_{\mathcal{Z}_{\Gamma}}=\left.\Omega\right|_{\left[z_{0}^{\mathcal{L}\left(\mathbf{d}_{R}\right)} z_{1}^{\mathcal{L}\left(\mathrm{d}_{L}\right)} a_{1}, \ldots, z_{0}^{\mathcal{L}\left(\mathrm{d}_{R}\right)} z_{1}^{\mathcal{L}\left(\mathrm{d}_{L}\right)} a_{n}\right]}=\mathbf{e}(\mathcal{L})(I)+\left\langle c_{1}(\mathcal{L}), \mathbf{d}_{L}\right\rangle \hbar, \tag{5.29}
\end{equation*}
$$

where $\mathbf{e}(\mathcal{L})$ is the $\mathbb{T}^{N}$-equivariant Euler class of $\mathcal{L}$.
By Proposition [2.16, there exist very ample line bundles $\mathcal{L}_{i}$ for all $i \in[k]$ such that $\left\{c_{1}\left(\mathcal{L}_{i}\right): i \in[k]\right\}$ is a basis for $H^{2}\left(X_{M}^{\tau}\right)$; so, using the $\mathbb{T}^{N}$-action on each $\mathcal{L}_{i}$ defined by (2.23), we find that

$$
\operatorname{Span}_{\mathbb{Q}}\left\{\mathbf{e}\left(\mathcal{L}_{i}\right): i \in[k]\right\}=\operatorname{Span}_{\mathbb{Q}}\left\{x_{i}: i \in[k]\right\} .
$$

Via Proposition 2.2] (b), this shows that $\left\{\mathbf{e}\left(\mathcal{L}_{i}\right), \alpha_{j}: i \in[k], j \in[N]\right\}$ is a basis for $H_{\mathbb{T}_{N}}^{2}\left(X_{M}^{\tau}\right)$. As in [Gi2], we define a $\mathbb{Q}$-linear map from $H_{\mathbb{T}^{N}}^{2}\left(X_{M}^{\tau}\right)$ to $H_{\mathbb{T}^{1} \times \mathbb{T}^{N}}^{2}\left(\mathfrak{X}_{\mathbf{d}}\left(X_{M}^{\tau}\right)\right)$ by sending $\mathbf{e}\left(\mathcal{L}_{i}\right)$ to $\Omega\left(\mathcal{L}_{i}\right)$ for all $i \in[k]$ and $\alpha_{j}$ to $\alpha_{j}$ for all $j \in[N]$. Let $\Omega_{i} \in H_{\mathbb{T}^{1} \times \mathbb{T}^{N}}^{2}\left(\mathcal{X}_{\mathbf{d}}\left(X_{M}^{\tau}\right)\right)$ be the image of $x_{i}$ under this map. The claim now follows from (5.29).

Lemma 5.15. Let $\eta^{\beta} \equiv \prod_{j=2}^{m}\left(\psi_{j}^{\beta_{j}} \operatorname{ev}_{j}^{*} \eta_{j}\right)$ in $H_{\mathbb{T}^{N}}^{*}\left(\overline{\mathfrak{M}}_{0, m}\left(X_{M}^{\tau}, \mathbf{d}\right)\right)$ and let

$$
\pi: \overline{\mathfrak{M}}_{0, m}\left(\mathbb{P} V \times X_{M}^{\tau},(1, \mathbf{d})\right) \longrightarrow \overline{\mathfrak{M}}_{0, m}\left(X_{M}^{\tau}, \mathbf{d}\right)
$$

denote the natural projection. With $\Phi$ as in Definition 5.5 and $\Omega_{i}$ as in Lemma 5.14,

$$
\begin{align*}
& (-\hbar)^{m-2} \Phi_{\ddot{\mathcal{Z}}_{1}, \dot{\mathcal{Z}}_{\eta, \beta}}(\hbar, z, Q)=\sum_{\mathbf{d} \in \Lambda} Q^{\mathrm{d}} \int_{\left[\tilde{\mathcal{X}}_{\mathbf{d}}\left(X_{M}^{\tau}\right)\right]^{\mathrm{eir}}} \mathrm{e}^{\sum_{i=1}^{k} \Omega_{i} z_{i}} \pi^{*}\left[\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right) \eta^{\beta}\right] \prod_{j=3}^{m} \operatorname{ev}_{j}^{*} \mathbf{e}\left(\mathcal{O}_{\mathbb{P} V}(1)\right), \\
& (-\hbar)^{m-2} \Phi_{\dot{\mathcal{Z}}_{1}, \dddot{\mathcal{Z}}_{\eta, \beta}}(\hbar, z, Q)=\sum_{\mathbf{d} \in \Lambda} Q^{\mathrm{d}} \int_{\left[\mathfrak{X}_{\mathbf{d}}\left(X_{M}^{\tau}\right)\right]^{\tau i r}} \mathrm{e}^{\sum_{i=1}^{k} \Omega_{i} z_{i}} \pi^{*}\left[\mathbf{e}\left(\ddot{\mathcal{V}}_{E}\right) \eta^{\beta}\right] \prod_{j=3}^{m} \mathrm{ev}_{j}^{*} \mathrm{e}\left(\mathcal{O}_{\mathbb{P} V}(1)\right) . \tag{5.30}
\end{align*}
$$

Proof. We apply the Virtual Localization Theorem (5.16) to the right-hand side of each of the two equations in (5.30), using Section 5.4 and extending the proof of [Z1, Lemma 3.1] from the case of a positive line bundle over $\mathbb{P}^{n-1}$ to that of a split vector bundle $E=E^{+} \oplus E^{-}$ as in (1.5) over an arbitrary symplectic toric manifold $X_{M}^{\tau}$. The possible contributing fixed loci graphs are described above. Given such a fixed locus graph $\Gamma$, we denote by $N_{\Gamma}^{v i r}$ the virtual normal bundle to the corresponding component of the fixed locus inside the moduli space. We denote by $\mathcal{A}_{I}$ the set of all $\mathbb{T}^{1} \times \mathbb{T}^{N}$-fixed loci graphs whose unique edge of positive $\mathbb{P} V$-degree corresponds to a map $\mathbb{P}^{1} \longrightarrow \mathbb{P} V \times[I]$, where $I \in \mathscr{V}_{M}^{\tau}$. A graph $\Gamma \in \mathcal{A}_{I}$ breaks into 3 graphs $-\Gamma_{L}, \Gamma_{R}$, and $\Gamma_{0}$ - as follows; see also Figure $5.3{ }^{10}$ The graph $\Gamma_{L}$ is obtained by considering all vertices and edges of $\Gamma$ to the left of the special edge (of positive $\mathbb{P} V$-degree) and adding a marked point labeled 2 at the vertex belonging to the special edge. Given that all vertices in this "left-hand side graph" are labeled ( $[1,0], I$ ) for some $I \in \mathscr{V}_{M}^{\tau}$, it defines a component of $\overline{\mathfrak{M}}_{0,2}\left(X_{M}^{\tau}, \mathbf{d}_{L}\right)^{\mathbb{T}^{N}}$. The graph $\Gamma_{R}$ is obtained by considering all vertices of $\Gamma$ to the right of the special edge and adding a marked point labeled 1 at the vertex belonging to the special edge. Given that all vertices in this "right-hand side graph" are labeled ( $[0,1], I$ ) for some $I \in \mathscr{V}_{M}^{\tau}$, it defines a component of $\overline{\mathfrak{M}}_{0, m}\left(X_{M}^{\tau}, \mathbf{d}_{R}\right)^{\mathbb{T}^{N}}$. Finally, $\Gamma_{0}$ is the special edge with 2 marked points added. They are labeled 1 in the left-hand side and 2 in the right-hand side. Thus,

$$
\mathcal{Z}_{\Gamma} \cong \mathcal{Z}_{\Gamma_{L}} \times \mathcal{Z}_{\Gamma_{0}} \times \mathcal{Z}_{\Gamma_{R}}
$$

[^7]

Figure 5.3: The three sub-graphs of the graph in Figure 5.2
we denote by $\pi_{L}, \pi_{0}$, and $\pi_{R}$ the corresponding projections.
It follows that

$$
\begin{align*}
\pi^{*} \dot{\mathcal{V}}_{E} & =\pi_{L}^{*} \dot{\mathcal{V}}_{E} \oplus \pi_{R}^{*} \dot{\mathcal{V}}_{E}, \quad \pi^{*} \ddot{\mathcal{V}}_{E}=\pi_{L}^{*} \ddot{\mathcal{V}}_{E} \oplus \pi_{R}^{*} \ddot{\mathcal{V}}_{E}, \\
\frac{N_{\Gamma}^{v i r}}{T_{[I]} X_{M}^{\tau}} & =\pi_{L}^{*}\left(\frac{N_{\Gamma_{L}}^{v i r}}{T_{[I]} X_{M}^{\tau}}\right) \oplus \pi_{R}^{*}\left(\frac{N_{\Gamma_{R}}^{v i r}}{T_{[I]} X_{M}^{\tau}}\right) \oplus \pi_{L}^{*} L_{2} \otimes \pi_{0}^{*} L_{1} \oplus \pi_{0}^{*} L_{2} \otimes \pi_{R}^{*} L_{1}, \tag{5.31}
\end{align*}
$$

where $L_{2} \longrightarrow \mathcal{Z}_{\Gamma_{L}}, L_{1}, L_{2} \longrightarrow \mathcal{Z}_{\Gamma_{0}}$, and $L_{1} \longrightarrow \mathcal{Z}_{\Gamma_{R}}$ are the tautological tangent line bundles. The first two equations in (5.31) follow similarly to (5.22).

By (5.31) and (2.34),

$$
\begin{array}{r}
\left.\pi^{*}\left[\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right) \eta^{\beta}\right] \prod_{j=3}^{m} \operatorname{ev}_{j}^{*}\left[\mathbf{e}\left(\mathcal{O}_{\mathbb{P} V}(1)\right)\right]\right|_{\mathcal{Z}_{\Gamma}}=\pi_{L}^{*}\left[\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right)\right] \pi_{R}^{*}\left[\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right) \eta^{\beta}(-\hbar)^{m-2}\right] \\
\frac{\mathbf{e}\left(T_{[I]} X_{M}^{\tau}\right)}{\mathbf{e}\left(N_{\Gamma}^{v i r}\right)}=\pi_{L}^{*}\left[\frac{\mathrm{ev}_{2}^{*} \phi_{I}}{\mathbf{e}\left(N_{\Gamma_{L}}^{v i r}\right)}\right] \pi_{R}^{*}\left[\frac{\mathrm{ev}_{1}^{*} \phi_{I}}{\mathbf{e}\left(N_{\Gamma_{R}}^{v i r}\right)}\right] \frac{1}{\left(\hbar-\pi_{L}^{*} \psi_{2}\right)\left((-\hbar)-\pi_{R}^{*} \psi_{1}\right)} \tag{5.32}
\end{array}
$$

and the first equation in (5.32) with $\dot{\mathcal{V}}_{E}$ replaced by $\ddot{\mathcal{V}}_{E}$ also holds. By (5.32) and Lemma 5.14,

$$
\begin{gather*}
\int_{\mathcal{Z}_{\Gamma}} \frac{\left.\mathrm{e}^{\sum_{i=1}^{k} \Omega_{i} z_{i}} \pi^{*}\left[\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right) \eta^{\beta}\right] \prod_{j=3}^{m} \operatorname{ev}_{j}^{*} \mathbf{e}\left(\mathcal{O}_{\mathbb{P} V}(1)\right)\right|_{\mathcal{Z}_{\Gamma}}}{\mathbf{e}\left(N_{\Gamma}^{v i r}\right)}=(-\hbar)^{m-2} \frac{\mathrm{e}^{\sum_{i=1}^{k} x_{i}(I) z_{i}}}{\mathbf{e}\left(T_{[I]} X_{M}^{\tau}\right)}  \tag{5.33}\\
\times\left\{\left.\mathrm{e}^{\sum_{i=1}^{k}\left(\mathbf{d}_{L}\right)_{i} z_{i} \hbar} \int_{\mathcal{Z}_{\Gamma_{L}}} \frac{\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right) \mathrm{ev}_{2}^{*} \phi_{I}}{\hbar-\psi_{2}}\right|_{\mathcal{Z}_{\Gamma_{L}}} \frac{1}{\mathbf{e}\left(N_{\Gamma_{L}}^{v i r}\right)}\right\}\left\{\int_{\mathcal{Z}_{\Gamma_{R}}} \frac{\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right) \eta^{\beta} \mathrm{ev}_{1}^{*} \phi_{I}}{(-\hbar)-\psi_{1}} \frac{1}{\mathbf{e}\left(N_{\Gamma_{R}}^{v i r}\right)}\right\} ;
\end{gather*}
$$

(5.33) with $\dot{\mathcal{V}}_{E}$ replaced by $\ddot{\mathcal{V}}_{E}$ also holds. In the $\mathbf{d}_{L}=0$ case, the first curly bracket on the right-hand side of (5.33) is defined to be 1. By the Virtual Localization Theorem (5.16) and (2.21),

$$
\begin{align*}
\sum_{\Gamma_{L}} Q^{\mathbf{d}_{L}}\left\{\left.\mathrm{e}^{\sum_{i=1}^{k}\left(\mathbf{d}_{L}\right)_{i} z_{i} \hbar} \int_{\mathcal{Z}_{\Gamma_{L}}} \frac{\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right) \mathrm{ev}_{2}^{*} \phi_{I}}{\hbar-\psi_{2}}\right|_{\mathcal{Z}_{\Gamma_{L}}} \frac{1}{\mathbf{e}\left(N_{\Gamma_{L}}^{v i r}\right)}\right\} & =\left.\ddot{\mathcal{Z}}_{1}\left(\hbar, Q \mathrm{e}^{\hbar z}\right)\right|_{I}  \tag{5.34}\\
& \sum_{\Gamma_{R}} Q^{\mathbf{d}_{R}}\left\{\int_{\mathcal{Z}_{\Gamma_{R}}} \frac{\mathbf{e}\left(\dot{\mathcal{V}}_{E}\right) \eta^{\beta} \mathrm{ev}_{1}^{*} \phi_{I}}{(-\hbar)-\psi_{1}} \frac{1}{\mathbf{e}\left(N_{\Gamma_{R}}^{v i r}\right)}\right\}=\left.\dot{\mathcal{Z}}_{\eta, \beta}(-\hbar, Q)\right|_{I},
\end{align*}
$$

where the first sum is taken after all graphs $\Gamma_{L}$ corresponding to components of $\overline{\mathfrak{M}}_{0,2}\left(X_{M}^{\tau}, \mathbf{d}_{L}\right)^{\mathbb{T}^{N}}$ and with second marked point mapping to $[I]$, while the second is taken after all graphs corresponding to components of $\overline{\mathfrak{M}}_{0, m}\left(X_{M}^{\tau}, \mathbf{d}_{R}\right)^{\mathbb{T}^{N}}$ such that the first marked point is mapped to [I]. The equation obtained from (5.34) by replacing $\dot{\mathcal{V}}_{E}$ by $\ddot{\mathcal{V}}_{E}, \ddot{\mathcal{Z}}_{1}$ by $\dot{\mathcal{Z}}_{1}$, and $\dot{\mathcal{Z}}_{\eta, \beta}$ by $\ddot{\mathcal{Z}}_{\eta, \beta}$ also holds. The claims follow from (5.33) and (5.34) (and their $\ddot{\mathcal{V}}_{E}$ analogues), by summing the left-hand side of (5.33) over all graphs $\Gamma \in \mathcal{A}_{I}$ and all $I \in \mathscr{V}_{M}^{\tau}$.

### 5.7 Recursivity and MPC for the explicit power series

As in [Gi2], for each $I \in \mathscr{V}_{M}^{\tau}$ we define

$$
\begin{equation*}
\Delta_{I}^{*} \equiv\left\{\mathbf{d} \in \Lambda: D_{j}(\mathbf{d}) \geqslant 0 \quad \forall j \in I\right\} \tag{5.35}
\end{equation*}
$$

By (4.6), (4.7), and (2.30),

$$
\begin{equation*}
\llbracket \dot{\mathcal{Y}}(x(I), \hbar, q) \rrbracket_{q ; \mathbf{d}} \neq 0 \Longrightarrow \mathbf{d} \in \Delta_{I}^{*} \quad \text { and } \quad \llbracket \ddot{\mathcal{Y}}(x(I), \hbar, q) \rrbracket_{q ; \mathbf{d}} \neq 0 \Longrightarrow \mathbf{d} \in \Delta_{I}^{*} \tag{5.36}
\end{equation*}
$$

Lemma 5.16. The power series $\dot{\mathcal{Y}}(x, \hbar, q)$ of (4.7) is $\dot{\mathfrak{C}}$-recursive with $\dot{\mathfrak{C}}$ given by (5.20). The power series $\ddot{\mathcal{Y}}(x, \hbar, q)$ of (4.7) is $\ddot{\mathfrak{C}}$-recursive with $\dddot{\mathfrak{C}}$ given by (5.2Q).
Proof. The recursivity of $\dot{\mathcal{Y}}$ in the $E=E^{+}$case is Gi2, Proposition 6.3]. The proof of the recursivity of $\dot{\mathcal{Y}}$ in the general case is similar and so is the proof of the recursivity of $\ddot{\mathcal{Y}}$. We prove below the recursivity of $\ddot{\mathcal{Y}}$ extending the proof of (a) in [Z1, Section 2.3] and the proof of [Gi2, Proposition 6.3]. Let $I \in \mathscr{V}_{M}^{\tau}, j \in[N]-I, J \equiv v(I, j),\{\hat{j}\} \equiv I-J$. By (5.36), (4.7), Remark (5.4, and (5.9),

$$
\begin{align*}
& \ddot{\mathcal{Y}}\left(x(J),-\frac{u_{j}(I)}{d}, q\right)=\sum_{\substack{\mathbf{d}^{\prime} \in \Delta^{*} \\
D_{j^{\prime}}\left(\mathbf{d}^{\prime}\right) \geqslant-d}} q^{\mathbf{d}^{\prime}} \frac{\prod_{\substack{r \in[N] \\
D_{r}\left(\mathbf{d}^{\prime}\right)<0}} \prod_{\substack{s=D_{r}\left(\mathbf{d}^{\prime}\right)+1}}^{0} \prod_{s=1}^{D_{r}\left(\mathbf{d}^{\prime}\right) \geqslant 0} \substack{D_{r}\left(\mathbf{d}^{\prime}\right)}}{}\left[u_{r}(J)-\frac{s}{d} u_{j}(I)\right]  \tag{5.37}\\
& \quad \times \prod_{i=1}^{a} u_{s=0}^{L_{i}^{+}\left(\mathbf{d}^{\prime}\right)-1}\left[\lambda_{i}^{+}(J)-\frac{s}{d} u_{j}(I)\right] \prod_{i=1}^{b} \prod_{s=1}^{-L_{i}^{-}\left(\mathbf{d}^{\prime}\right)}\left[\lambda_{i}^{-}(J)+\frac{s}{d} u_{j}(I)\right] .
\end{align*}
$$

By (5.37), (5.12), and (5.11),

$$
\begin{align*}
& \ddot{\mathcal{Y}}\left(x(J),-\frac{u_{j}(I)}{d}, q\right)=\sum_{\substack{\mathbf{d}^{\prime} \in \Delta_{J}^{*} \\
D_{\hat{j}}\left(\mathbf{d}^{\prime}\right) \geqslant-d}} q^{\mathbf{d}^{\mathbf{d}}} \frac{\prod_{\substack{r \in[N] \\
D_{r}\left(\mathbf{d}^{\prime}\right)<0}} \prod_{\substack{r \in[N] \\
D_{r}\left(\mathbf{d}^{\prime}\right) \geqslant 0}} \prod_{\substack{ \\
D_{r}\left(\mathbf{d}^{\prime}\right)+d D_{r}(\overline{I J})}}^{\prod_{s=1+d D_{r}(\overline{I j})}^{\left.d \mathbf{d}_{r}\right)+1+d D_{r}(\overline{I J})}}\left[u_{r}(I)-\frac{s}{d} u_{j}(I)\right]}{}  \tag{5.38}\\
& \times \prod_{i=1}^{a} \prod_{s=d L_{i}^{+}(\overline{I J})}^{L_{i}^{+}\left(\mathbf{d}^{\prime}\right)-1+d L_{i}^{+}(\overline{I j})}\left[\lambda_{i}^{+}(I)-\frac{s}{d} u_{j}(I)\right] \prod_{i=1}^{b} \prod_{s=1-d L_{i}^{-}(\overline{I j})}^{-L_{i}^{-}\left(\mathbf{d}^{\prime}\right)-d L_{i}^{-}(\overline{I j})}\left[\lambda_{i}^{-}(I)+\frac{s}{d} u_{j}(I)\right] .
\end{align*}
$$

By (5.13) and (5.19),

$$
\begin{equation*}
\tilde{\mathfrak{C}}_{I, j}(d)=\frac{(-1)^{d} d^{2 d-1}}{(d!)^{2}} \frac{1}{\left[u_{j}(I)\right]^{2 d-1}} \prod_{r \in[N]-\{j, \hat{j}\}} \frac{\prod_{s=1+d D_{r}(\overline{J j})}^{0}\left[u_{r}(I)-\frac{s}{d} u_{j}(I)\right]}{\prod_{s=1}^{d D_{r}(\overline{T j})}\left[u_{r}(I)-\frac{s}{d} u_{j}(I)\right]} . \tag{5.39}
\end{equation*}
$$

If $d \geqslant 1, \mathbf{d}^{*} \in \Lambda, \mathbf{d}^{\prime} \equiv \mathbf{d}^{*}-d \cdot \operatorname{deg} \overline{I j} \in \Lambda$, then,

$$
\begin{equation*}
\left[\mathbf{d}^{*} \in \Delta_{I}^{*} \text { and } D_{j}\left(\mathbf{d}^{*}\right) \geqslant d\right] \quad \Longleftrightarrow \quad\left[\mathbf{d}^{\prime} \in \Delta_{J}^{*} \text { and } D_{\hat{j}}\left(\mathbf{d}^{\prime}\right) \geqslant-d\right] \tag{5.40}
\end{equation*}
$$

by (5.13). By (5.36), (4.7), (5.38), (5.39), and (5.20),

$$
\operatorname{Res}_{z=-\frac{u_{j}(I)}{d}}\left\{\frac{1}{\hbar-z} \llbracket \ddot{\mathscr{Y}}(x(I), z, q) \rrbracket_{q ; \mathbf{d}^{*}}\right\}=\frac{\dddot{\mathfrak{C}}_{I, j}(d)}{\hbar+\frac{u_{j}(I)}{d}} \llbracket \ddot{\mathcal{Y}}\left(x(J),-\frac{u_{j}(I)}{d}, q\right) \rrbracket_{q ; \mathbf{d}^{*}-d \cdot \operatorname{deg} \overline{I j}}
$$

for all $\mathbf{d}^{*} \in \Lambda$. Finally, viewing $\frac{1}{\hbar-z} \llbracket \ddot{\mathcal{Y}}(x(I), z, q) \rrbracket_{q ; \mathbf{d}^{*}}$ as a rational function in $\hbar, z$, and $\alpha_{j}$ and using the Residue Theorem on $\mathbb{P}^{1}$, we obtain

$$
\begin{array}{r}
\sum_{\substack{d \geqslant 1 \\
d \cdot \operatorname{deg} \overline{I j} \leq \mathbf{d}^{*}}} \frac{\ddot{\mathfrak{C}}_{I, j}(d)}{\hbar+\frac{u_{j}(I)}{d}} \llbracket \ddot{\mathcal{Y}}\left(x(J),-\frac{u_{j}(I)}{d}, q\right) \rrbracket_{q ; \mathbf{d}^{*}-d \cdot \operatorname{deg} \overline{I j}}=\llbracket \ddot{\mathcal{Y}}(x(I), \hbar, q) \rrbracket_{q ; \mathbf{d}^{*}} \\
-\operatorname{Res}_{z=0, \infty}\left\{\frac{1}{\hbar-z} \llbracket \ddot{\mathcal{Y}}(x(I), z, q) \rrbracket_{q ; \mathbf{d}^{*}}\right\},
\end{array}
$$

where $\operatorname{Res}_{z=0, \infty} \mathcal{F} \equiv \operatorname{Res}_{z=0} \mathcal{F}+\operatorname{Res}_{z=\infty} \mathcal{F}$. Since

$$
\operatorname{Res}_{z=0, \infty}\left\{\frac{1}{\hbar-z} \llbracket \ddot{\mathcal{Y}}(x(I), z, q) \rrbracket_{q ; \mathbf{d}^{*}}\right\} \in \mathbb{Q}_{\alpha}\left[\hbar, \hbar^{-1}\right]
$$

this concludes the proof.
Lemma 5.17. With $\dot{\mathcal{Y}}$ and $\ddot{\mathcal{Y}}$ defined by (4.7), $(\dot{\mathcal{Y}}, \ddot{\mathcal{Y}})$ satisfies the MPC.
We follow the idea of the proof of [Gi2, Proposition 6.2] and begin with some preparations. Let $\mathbf{d} \in \bigcup_{I \in \mathscr{V}_{M}^{\top}} \Delta_{I}^{*}$,

$$
J \equiv J(\mathbf{d}) \equiv\left\{j \in[N]: D_{j}(\mathbf{d}) \geqslant 0\right\}, \quad S \equiv|J|+\sum_{j \in J} D_{j}(\mathbf{d}) .
$$

Let $A$ be the $|J| \times S$ matrix giving $\prod_{j \in J} \mathbb{P}^{D_{j}(\mathbf{d})}$ as in (2.37). Denote the coordinates of a point $y \in \mathbb{C}^{S}$ by

$$
\left(y_{j ; 0}, y_{j ; 1}, \ldots, y_{j ; D_{j}(\mathbf{d})}\right)_{j \in J}
$$

The pair $\left(M_{J} A, \tau\right)$ is toric in the sense of Definition 2.1. It satisfies (ii) in Definition 2.1, since

$$
\begin{align*}
\mathscr{V}_{M_{J} A}^{\tau}=\{ & \left(\left(i_{1} ; p_{1}\right), \ldots,\left(i_{k} ; p_{k}\right)\right): \\
& \left.\left\{i_{1}, \ldots, i_{k}\right\} \in \mathscr{V}_{M}^{\tau},\left\{i_{1}, \ldots, i_{k}\right\} \subseteq J, 0 \leqslant p_{r} \leqslant D_{i_{r}}(\mathbf{d}) \quad \forall r \in[k]\right\} \tag{5.41}
\end{align*}
$$

by the second statement in Lemma 2.4 (b). We identify $\mathbb{C}^{S}$ with $\bigoplus_{j \in J} H^{0}\left(\mathbb{P}^{1}, \mathcal{O}_{\mathbb{P}^{1}}\left(D_{j}(\mathbf{d})\right)\right)$ via

$$
\left(y_{j ; 0}, y_{j ; 1}, \ldots, y_{j ; D_{j}(\mathbf{d})}\right)_{j \in J} \longrightarrow\left(\sum_{r=0}^{D_{j}(\mathbf{d})} y_{j ; r} z_{0}^{D_{j}(\mathbf{d})-r} z_{1}^{r}\right)_{j \in J}
$$

and set $X_{\mathbf{d}} \equiv X_{M_{J} A}^{\tau}$. The torus $\mathbb{T}^{1} \times \mathbb{T}^{|J|}$ acts on $\bigoplus_{j \in J} H^{0}\left(\mathbb{P}^{1}, \mathcal{O}_{\mathbb{P}^{1}}\left(D_{j}(\mathbf{d})\right)\right.$ by

$$
\begin{equation*}
\left(\xi,\left(t_{j}\right)_{j \in J}\right) \cdot\left(P_{j}\left(z_{0}, z_{1}\right)\right)_{j \in J} \equiv\left(t_{j} P_{j}\left(z_{0}, \xi z_{1}\right)\right)_{j \in J} \tag{5.42}
\end{equation*}
$$

while the torus $\mathbb{T}^{|J|}$ acts on $\underset{j \in J}{\bigoplus} H^{0}\left(\mathbb{P}^{1}, \mathcal{O}_{\mathbb{P}^{1}}\left(D_{j}(\mathbf{d})\right)\right)$ by restricting this action via

$$
\mathbb{T}^{|J|} \ni t \hookrightarrow(1, t) \in \mathbb{T}^{1} \times \mathbb{T}^{|J|} ;
$$

these actions descend to actions on $X_{\mathbf{d}}$.
Lemma 5.18. (a) The fixed points of the $\mathbb{T}^{1} \times \mathbb{T}^{|J|}$-action on $X_{\mathbf{d}}$ are

$$
\begin{equation*}
[I, \mathbf{p}] \equiv\left[\left(P_{j}\left(z_{0}, z_{1}\right)\right)_{j \in J}\right] \tag{5.43}
\end{equation*}
$$

where $I \in \mathscr{V}_{M}^{\tau}, I \subseteq J, \mathbf{p}=\left(p_{i}\right)_{i \in I} \in \mathbb{Z}^{k}, 0 \leqslant p_{i} \leqslant D_{i}(\mathbf{d})$ for all $i \in I$, and

$$
P_{j}\left(z_{0}, z_{1}\right) \equiv \begin{cases}z_{0}^{D_{j}(\mathbf{d})-p_{j}} z_{1}^{p_{j}}, & \text { if } j \in I \\ 0, & \text { otherwise }\end{cases}
$$

(b) Let $I \in \mathscr{V}_{M}^{\tau}$ and $\mathbf{p}=\left(p_{i}\right)_{i \in I} \in \mathbb{Z}^{k}$. Then

$$
0 \leqslant p_{i} \leqslant D_{i}(\mathbf{d}) \quad \forall i \in I \quad \Longleftrightarrow \quad \mathbf{p} M_{I}^{-1}, \mathbf{d}-\mathbf{p} M_{I}^{-1} \in \Delta_{I}^{*}
$$

Proof. Let $\left[\left(P_{j}\left(z_{0}, z_{1}\right)_{j \in J}\right)\right]$ be any fixed point of the $\mathbb{T}^{1} \times \mathbb{T}^{|J|}$-action on $X_{\mathbf{d}}$ and $\left(\xi_{0}, \xi_{1}\right) \in \mathbb{C}^{2}$ be such that $P_{j}\left(\xi_{0}, \xi_{1}\right) \neq 0$ whenever $P_{j} \neq 0$. By Lemma 2.4] $(i)$ and (5.41), $\left(P_{j}\left(\xi_{0}, \xi_{1}\right)\right)_{j \in J} \in \widetilde{X}_{M_{j}}^{\tau}$. Since $\left[\left(P_{j}\left(\xi_{0}, \xi_{1}\right)\right)_{j \in J}\right]$ is a $\mathbb{T}^{|J|}$-fixed point in $X_{M_{J}}^{\tau}$, there exists $I \in \mathscr{V}_{M}^{\tau}$ with $I \subseteq J$ such that $P_{j} \neq 0$ if and only if $j \in I$; see Corollary (2.2q)(a). This concludes the proof of (a), Part (b) follows from (5.35) and the identity $\left(D_{i}(\mathbf{r})\right)_{i \in I} \equiv \mathbf{r} M_{I}$ for $\mathbf{r}=\mathbf{p} M_{I}^{-1}$; see the second equation in (2.17).

We consider the $\mathbb{T}^{1} \times \mathbb{T}^{N}$-action on $X_{\mathbf{d}}$ obtained by composing the projection $\mathbb{T}^{1} \times \mathbb{T}^{N} \longrightarrow$ $\mathbb{T}^{1} \times \mathbb{T}^{|J|}$ induced by $J \hookrightarrow[N]$ with the action (5.42) of $\mathbb{T}^{1} \times \mathbb{T}^{|J|}$ on $X_{\mathrm{d}}$. We denote by $\widetilde{\mathbf{e}}\left(T_{[I, \mathbf{p}]} X_{\mathbf{d}}\right)$ the $\mathbb{T}^{1} \times \mathbb{T}^{N}$-equivariant Euler class of $T_{[I, \mathbf{p}]} X_{\mathbf{d}}$ and by

$$
\cdot(I, \mathbf{p}): H_{\mathbb{T}^{1} \times \mathbb{T}^{N}}^{*}\left(X_{\mathbf{d}}\right) \longrightarrow H_{\mathbb{T}^{1} \times \mathbb{T}^{N}}^{*}
$$

the restriction map induced by the inclusion $[I, \mathbf{p}] \hookrightarrow X_{\mathbf{d}}$, where $[I, \mathbf{p}]$ is the $\mathbb{T}^{1} \times \mathbb{T}^{N}$-fixed point defined by (5.43). Let $\hbar$ denote the weight of the standard action of $\mathbb{T}^{1}$ on $\mathbb{C}$.

Lemma 5.19. There exist classes $\left(\mathbf{x}_{i}\right)_{i \in[k]},\left(\mathbf{u}_{r}\right)_{r \in[N]},\left(\boldsymbol{\lambda}_{i}^{+}\right)_{i \in[a]},\left(\boldsymbol{\lambda}_{i}^{-}\right)_{i \in[b]} \in H_{\mathbb{T}^{1} \times \mathbb{T}^{N}}^{*}\left(X_{\mathbf{d}}\right)$ such that

$$
\begin{equation*}
\mathbf{u}_{r}=\sum_{i=1}^{k} m_{i r} \mathbf{x}_{i}-\alpha_{r} \quad \forall r \in[N], \tag{5.44}
\end{equation*}
$$

and such that for all $\left(I, \mathbf{d}^{\prime}\right)$ with $I \in \mathscr{V}_{M}^{\tau}, I \subseteq J, \mathbf{d}^{\prime}, \mathbf{d}-\mathbf{d}^{\prime} \in \Delta_{I}^{*}$, and all $[I, \mathbf{p}]$ as in (5.43),

$$
\begin{align*}
\left(\mathbf{x}_{1}\left(I, \mathbf{d}^{\prime} M_{I}\right), \ldots, \mathbf{x}_{k}\left(I, \mathbf{d}^{\prime} M_{I}\right)\right) & =\left(x_{1}(I), \ldots, x_{k}(I)\right)+\hbar \mathbf{d} \mathbf{d}^{\prime}  \tag{5.45}\\
\widetilde{\mathbf{e}}\left(T_{[I, \mathbf{p}]} X_{\mathbf{d}}\right) & =\prod_{j \in J-I} \prod_{0 \leqslant s \leqslant D_{j}(\mathbf{d})}\left[\mathbf{u}_{j}(I, \mathbf{p})-s \hbar\right]  \tag{5.46}\\
& \times \prod_{j \in I} \prod_{\substack{0 \leqslant s \leqslant D_{j}\left(\mathbf{d} \mathbf{d} \\
s \neq p_{j}\right.}}\left[\mathbf{u}_{j}(I, \mathbf{p})-s \hbar\right], \\
\boldsymbol{\lambda}_{i}^{ \pm}\left(I, \mathbf{d}^{\prime} M_{I}\right)= & \lambda_{i}^{ \pm}(I)+\hbar L_{i}^{ \pm}\left(\mathbf{d}^{\prime}\right) \quad \forall i \in[a] \quad(\forall i \in[b]) . \tag{5.47}
\end{align*}
$$

Proof. We define the classes $\widetilde{x}_{1}, \ldots, \widetilde{x}_{k}$ and $u_{j ; s}$ in $H_{\mathbb{T}}^{*}\left(X_{\mathbf{d}}\right)$ with $j \in J$ and $0 \leqslant s \leqslant D_{j}(\mathbf{d})$ by (2.27) with $(M, \tau)$ replaced by $\left(M_{J} A, \tau\right)$. By (2.29),

$$
\begin{equation*}
u_{j ; s}=\sum_{i=1}^{k} m_{i j} \widetilde{x}_{i}-\alpha_{j ; s}, \tag{5.48}
\end{equation*}
$$

where $\alpha_{j ; s} \equiv \pi_{j ; s}^{*} c_{1}\left(\mathcal{O}_{\mathbb{P}^{\infty}}(1)\right)$ and $\pi_{j ; s}:\left(\mathbb{P}^{\infty}\right)^{S} \longrightarrow \mathbb{P}^{\infty}$ is the projection onto the $(j ; s)$ component. By Corollary 2.2q(a), (5.41), and (2.34), the $\mathbb{T}^{S}$-fixed points in $X_{\mathbf{d}}$ are the points [ $\left.I, \mathbf{p}\right]$ and

$$
\begin{equation*}
\mathbf{e}^{\mathbb{T}^{S}}\left(T_{[I, \mathbf{p}]} X_{\mathbf{d}}\right)=\prod_{j \in J-I} \prod_{0 \leqslant s \leqslant D_{j}(\mathbf{d})}\left[\left.u_{j ; s}\right|_{[I, \mathbf{p}]}\right] \times \prod_{j \in I} \prod_{\substack{0 \leqslant s \leqslant D_{j}(\mathbf{d}) \\ s \neq p_{j}}}\left[\left.u_{j ; s}\right|_{[I, \mathbf{p}]}\right], \tag{5.49}
\end{equation*}
$$

where $\mathbf{e}^{\mathbb{T}^{S}}\left(T_{[I, \mathbf{p}]} X_{\mathbf{d}}\right)$ denotes the $\mathbb{T}^{S}$-equivariant Euler class of $T_{[I, \mathbf{p}]} X_{\mathbf{d}}$ and

$$
\left.\right|_{[I, \mathbf{p}]}: H_{\mathbb{T} S}^{*}\left(X_{\mathbf{d}}\right) \longrightarrow H_{\mathbb{T} S}^{*}
$$

the restriction homomorphism induced by $[I, \mathbf{p}] \hookrightarrow X_{\mathbf{d}}$. The map

$$
F:\left(\mathbb{C}^{\infty}-\{0\}\right)^{N+1} \longrightarrow\left(\mathbb{C}^{\infty}-\{0\}\right)^{S}, \quad F\left(e_{0}, e_{1}, \ldots, e_{N}\right) \equiv\left(e_{j}, e_{j} \cdot e_{0}, e_{j} \cdot e_{0}^{2}, \ldots, e_{j} \cdot e_{0}^{D_{j}(\mathbf{d})}\right)_{j \in J}
$$

where

$$
\begin{aligned}
\left(z_{1}, z_{2}, \ldots\right)^{d} & \equiv\left(z_{1}^{d}, z_{2}^{d}, \ldots\right) \quad \forall d \geqslant 1,\left(z_{1}, z_{2}, \ldots\right) \in \mathbb{C}^{\infty}-\{0\}, \quad \text { and } \\
\left(z_{1}, z_{2}, \ldots\right) \cdot\left(y_{1}, y_{2}, \ldots\right) & \equiv\left(z_{i} y_{j}\right)_{(i, j) \in \mathbb{Z}^{>0} \times \mathbb{Z}^{>0}} \quad \forall\left(z_{1}, z_{2}, \ldots\right),\left(y_{1}, y_{2}, \ldots\right) \in \mathbb{C}^{\infty}-\{0\}
\end{aligned}
$$

is equivariant with respect to the homomorphism

$$
f: \mathbb{T}^{1} \times \mathbb{T}^{N} \longrightarrow \mathbb{T}^{S}, \quad f\left(\xi, t_{1}, \ldots, t_{N}\right) \equiv\left(t_{j}, t_{j} \xi, t_{j} \xi^{2}, \ldots, t_{j} \xi^{D_{j}(\mathbf{d})}\right)_{j \in J}
$$

It induces a map $\bar{F}:\left(\mathbb{C}^{\infty}-\{0\}\right)^{N+1} \times_{\mathbb{T}^{1} \times \mathbb{T}^{N}} X_{\mathbf{d}} \longrightarrow\left(\mathbb{C}^{\infty}-\{0\}\right)^{S} \times_{\mathbb{T}^{S}} X_{\mathbf{d}}$,

$$
\begin{aligned}
\bar{F}\left[e_{0}, e_{1}, \ldots, e_{N},\left[\left(P_{j}\right)_{j \in J J}\right]\right] \equiv & {\left.\left[F\left(e_{0}, e_{1}, \ldots, e_{N}\right),\left[\left(P_{j}\right)_{j \in J}\right]\right]\right] } \\
& \forall\left(e_{0}, e_{1}, \ldots, e_{N}\right) \in\left(\mathbb{C}^{\infty}-0\right)^{N+1},\left[\left(P_{j}\right)_{j \in J}\right] \in X_{\mathbf{d}},
\end{aligned}
$$

and thus a homomorphism $\bar{F}^{*}: H_{\mathbb{T}^{S}}^{*}\left(X_{\mathbf{d}}\right) \longrightarrow H_{\mathbb{T}^{1} \times \mathbb{T}^{N}}^{*}\left(X_{\mathbf{d}}\right)$. It follows that

$$
\begin{equation*}
\bar{F}^{*} \alpha_{j ; s}=\alpha_{j}+s \hbar \quad \forall(j ; s) \quad \text { with } \quad j \in J, 0 \leqslant s \leqslant D_{j}(\mathbf{d}) . \tag{5.50}
\end{equation*}
$$

We define $\mathbf{x}_{i}$ and $\mathbf{u}_{r}$ as the $\mathbb{T}^{1} \times \mathbb{T}^{N}$-equivariant Euler classes of the line bundles

$$
\tilde{X}_{M_{J} A}^{\tau} \times \mathbb{C} / \sim_{i} \longrightarrow X_{\mathbf{d}} \quad \text { and } \quad \tilde{X}_{M_{J} A}^{\tau} \times \mathbb{C} / \sim_{r} \longrightarrow X_{\mathbf{d}}
$$

where

$$
\begin{align*}
& \left(\left(P_{j}\right)_{j \in J}, c\right) \sim_{i}\left(\left(t^{M_{j}} P_{j}\right)_{j \in J}, t_{i} c\right)  \tag{5.51}\\
& \left(\left(P_{j}\right)_{j \in J}, c\right) \sim_{r}\left(\left(t^{M_{j}} P_{j}\right)_{j \in J}, t^{M_{r}} c\right)
\end{align*} \quad \forall t \in \mathbb{T}^{k},\left(\left(P_{j}\right)_{j \in J}, c\right) \in \tilde{X}_{M_{J} A}^{\tau} \times \mathbb{C}
$$

with respect to the lifts of the $\mathbb{T}^{1} \times \mathbb{T}^{N}$-action on $X_{\mathbf{d}}$ given by

$$
\begin{align*}
& \left(\xi, t_{1}, \ldots, t_{N}\right) \cdot\left[\left(P_{j}\left(z_{0}, z_{1}\right)\right)_{j \in J}, c\right] \equiv\left[\left(t_{j} P_{j}\left(z_{0}, \xi z_{1}\right)\right)_{j \in J}, c\right] \quad \text { and } \\
& \left(\xi, t_{1}, \ldots, t_{N}\right) \cdot\left[\left(P_{j}\left(z_{0}, z_{1}\right)\right)_{j \in J}, c\right] \equiv\left[\left(t_{j} P_{j}\left(z_{0}, \xi z_{1}\right)\right)_{j \in J}, t_{r} c\right] \tag{5.52}
\end{align*}
$$

respectively. It follows that

$$
\begin{equation*}
\mathbf{x}_{i}=\bar{F}^{*} \widetilde{x}_{i} \tag{5.53}
\end{equation*}
$$

and $\mathbf{u}_{j}$ satisfy (5.44). The latter follows similarly to the proof of (2.29) using equations analogous to $(2.25)$ and (2.26) with $\mathbb{T}^{N}$ replaced by $\mathbb{T}^{1} \times \mathbb{T}^{N}$. Equation (5.45) follows from (5.53), Proposition [2.21) (a), and (5.50). Equation (5.55) follows from (5.44), (5.45), and (2.29). Equation (5.46) follows from (5.49) together with (5.48), (5.50), (5.53), and (5.44). Finally, define

$$
\begin{equation*}
\boldsymbol{\lambda}_{i}^{+} \equiv \sum_{r=1}^{k} \ell_{r i}^{+} \mathbf{x}_{r} \quad \text { and } \quad \boldsymbol{\lambda}_{i}^{-} \equiv \sum_{r=1}^{k} \ell_{r i}^{-} \mathbf{x}_{r}, \tag{5.54}
\end{equation*}
$$

with $\ell_{r i}^{+}, \ell_{r i}^{-}$as in (3.5). Equations (5.47) then follow from (5.54), (5.45), and (4.4).
With $\mathbf{u}_{j}$ and $\left(I, \mathbf{d}^{\prime}\right)$ as in Lemma 5.19,

$$
\begin{equation*}
\mathbf{u}_{j}\left(I, \mathbf{d}^{\prime} M_{I}\right)=u_{j}(I)+\hbar D_{j}\left(\mathbf{d}^{\prime}\right) \quad \forall j \in[N] \tag{5.55}
\end{equation*}
$$

by (5.44), (5.45), and (2.29).

Lemma 5.20. There exists a vector bundle $V_{\mathbf{d}} \longrightarrow X_{\mathbf{d}}$ and a lift of the $\mathbb{T}^{1} \times \mathbb{T}^{N}$-action to $V_{\mathbf{d}}$ such that the $\mathbb{T}^{1} \times \mathbb{T}^{N}$-equivariant Euler class $\widetilde{\mathbf{e}}\left(V_{\mathbf{d}}\right)$ satisfies

$$
\widetilde{\mathbf{e}}\left(V_{\mathbf{d}}\right)(I, \mathbf{p})=\prod_{j=1}^{N} \prod_{s=1}^{-D_{j}(\mathbf{d})-1}\left[\mathbf{u}_{j}(I, \mathbf{p})+s \hbar\right]
$$

for all $\mathbb{T}^{1} \times \mathbb{T}^{N}$-fixed points $[I, \mathbf{p}]$ defined by (5.43) and with $\mathbf{u}_{j} \in H_{\mathbb{T}^{1} \times \mathbb{T}^{N}}^{*}\left(X_{\mathbf{d}}\right)$ as in Lemma 5.19. Proof. Let

$$
\begin{aligned}
& \widetilde{V}_{\mathbf{d}} \equiv\left\{\left(P_{j}\right)_{j \in[N]-J} \in \bigoplus_{j \in[N]-J} H^{0}\left(\mathbb{P}^{1}, \mathcal{O}_{\mathbb{P}^{1}}\left(-D_{j}(\mathbf{d})-1\right)\right): P_{j}(1,0)=0 \quad \forall j \in[N]-J\right\} \\
& V_{\mathbf{d}} \equiv \frac{\widetilde{X}_{M_{J} A}^{\tau} \times \widetilde{V}_{\mathbf{d}}}{\sim} \longrightarrow X_{\mathbf{d}}, \quad\left(\left(P_{j}\right)_{j \in J},\left(P_{j}\right)_{j \in[N]-J}\right) \sim\left(\left(t^{M_{j}} P_{j}\right)_{j \in J},\left(t^{M_{j}} P_{j}\right)_{j \in[N]-J}\right) \quad \forall t \in \mathbb{T}^{k} .
\end{aligned}
$$

Since $\tilde{X}_{M_{J} A}^{\tau} \longrightarrow X_{\mathbf{d}}$ is a principal bundle, $V_{\mathbf{d}} \longrightarrow X_{\mathbf{d}}$ is a holomorphic vector bundle. The $\mathbb{T}^{1} \times \mathbb{T}^{N}$-action on $X_{\mathbf{d}}$ lifts to $V_{\mathbf{d}}$ via $\left(\xi, t_{1}, \ldots, t_{N}\right) \cdot\left[\left(P_{j}\left(z_{0}, z_{1}\right)\right)_{j \in J},\left(P_{j}\left(z_{0}, z_{1}\right)\right)_{j \in[N]-J}\right] \equiv\left[\left(t_{j} P_{j}\left(z_{0}, \xi z_{1}\right)\right)_{j \in J},\left(t_{j} P_{j}\left(z_{0}, \xi z_{1}\right)\right)_{j \in[N]-J}\right]$.
The lemma now follows from the definition of $\mathbf{u}_{j}$ in (5.51) and (5.52).
By the Localization Theorem (2.22), Lemma 5.18, Lemma 5.20, and (5.46),

$$
\begin{equation*}
\int_{X_{\mathbf{d}}} f \widetilde{\mathbf{e}}\left(V_{\mathbf{d}}\right)=\sum_{\substack{I \in Y_{M}^{\tau} \\ \mathbf{d}^{\prime}, \mathbf{d}-\mathbf{d}^{\prime} \in \Delta_{I}^{*}}} \frac{f\left(I, \mathbf{d}^{\prime} M_{I}\right) \prod_{j=1}^{N} \prod_{\substack{ \\\prod_{j}=D_{j}(\mathbf{d})+1}}^{-1}\left[\mathbf{u}_{j}\left(I, \mathbf{d}^{\prime} M_{I}\right)-s \hbar\right]}{\prod_{0 \leqslant s \leqslant D_{j}(\mathbf{d})}\left[\mathbf{u}_{j}\left(I, \mathbf{d}^{\prime} M_{I}\right)-s \hbar\right] \prod_{\substack{j \in I}} \prod_{\substack{0 \leqslant s \leqslant D_{j}(\mathbf{d}) \\ s \neq D_{j}\left(\mathbf{d}^{\prime}\right)}}\left[\mathbf{u}_{j}\left(I, \mathbf{d}^{\prime} M_{I}\right)-s \hbar\right]}, \tag{5.56}
\end{equation*}
$$

for all $f \in H_{\mathbb{T}^{1} \times \mathbb{T}^{N}}^{*}\left(X_{\mathbf{d}}\right)$.
Proof of Lemma 5.17. By Definition 5.5), (5.36), (4.7), (5.56), (5.45), (5.55), and (5.47),

$$
\begin{aligned}
& \left.\times \prod_{i=1}^{a} \prod_{s=-L_{i}^{+}\left(\mathbf{d}^{\prime \prime}\right)+1}^{L_{i}^{+}\left(\mathbf{d}^{\prime}\right)}\left[\lambda_{i}^{+}(I)+s \hbar\right] \prod_{i=1}^{b} \prod_{s=L_{i}^{-}\left(\mathbf{d}^{\prime}\right)+1}^{-L_{i}^{-}\left(\mathbf{d}^{\prime \prime}\right)}\left[\lambda_{i}^{-}(I)+s \hbar\right]\right\} \\
& =\sum_{\mathbf{d} \in \bigcup_{I \in \mathcal{V}_{M}^{+}}^{\cup} \Delta_{I}^{*}} Q^{\mathbf{d}} \int_{X_{\mathbf{d}}} \widetilde{\mathbf{e}}\left(V_{\mathbf{d}}\right) \mathrm{e}^{\mathbf{x} \cdot z} \prod_{i=1}^{a} \prod_{s=-L_{i}^{+}(\mathbf{d})+1}^{0}\left[\boldsymbol{\lambda}_{i}^{+}+s \hbar\right] \prod_{i=1}^{b} \prod_{s=1}^{-L_{i}^{-}(\mathbf{d})}\left[\boldsymbol{\lambda}_{i}^{-}+s \hbar\right] .
\end{aligned}
$$

The last expression is in $\mathbb{Q}[\alpha, \hbar][[z, \Lambda]]$.

## Appendix A

## Derivation of (5.2) from [LLY3]

| [LLY3] | our notation |
| :---: | :---: |
| $m$ | $k$ |
| $e^{t_{j}}$ | $q_{j}$ |
| $\mathcal{R}$ | $\mathbb{C}\left(\alpha_{1}, \ldots, \alpha_{N}\right)[\hbar]$ |
| $\mathbb{C}\left[\mathcal{T}^{*}\right]$ | $\mathbb{Q}\left[\alpha_{1}, \ldots, \alpha_{N}\right]$ |
| $\alpha$ | $\hbar$ |
| $T$ | $\mathbb{T}^{N}$ |
| $e_{T}$ | $\mathbf{e}$ |
| $c_{1}\left(L_{d}\right)$ | $-\psi_{1} \in H^{2}\left(\overline{\mathfrak{M}}_{0,1}\left(X_{M}^{\tau}, \mathbf{d}\right)\right)$ |
| $\rho$ | forgetful morphism $\overline{\mathfrak{M}}_{0,1}(X, \mathbf{d}) \longrightarrow \overline{\mathfrak{M}}_{0,0}(X, \mathbf{d})$ |
| $e_{d}^{X}$ | ev $\overline{\mathfrak{M}}_{0}: \overline{\mathfrak{M}}_{0,1}(X, \mathbf{d}) \longrightarrow X$ |
| $L T_{0,1}(d, X)$ | $\left[\overline{\mathfrak{M}}_{0,1}(X, \mathbf{d})\right]^{\text {vir }}$ |
| $V_{d}$ | $\mathcal{V}_{E} \longrightarrow \overline{\mathfrak{M}}_{0,0}(X, \mathbf{d})$ |
| $U_{d}=\rho^{*} V_{d}$ | $\mathcal{V}_{E} \longrightarrow \overline{\mathfrak{M}}_{0,1}(X, \mathbf{d})$ |
| $\left(D_{a}\right)_{a \in[N]}$ | $\left(u_{j}\right)_{j \in[N]}$ |

In LLY3, Section 3.2], we take $b_{T} \equiv e_{T}$ (that is, $\mathbf{e}$ ), $X=X_{M}^{\tau}$, and $V \equiv E$. By LLY3, Section 3.2],

$$
A^{V, b_{T}}(t)=A(t)=e^{-H \cdot t / \alpha}\left[\frac{\mathbf{e}\left(E^{+}\right)}{\mathbf{e}\left(E^{-}\right)}+\sum_{d \in \Lambda-0} A_{d} e^{d \cdot t}\right], \quad A_{d}=\mathrm{e}_{*}^{X}\left(\frac{\rho^{*} b_{T}\left(V_{d}\right) \cap L T_{0,1}(d, X)}{e_{G}\left(F_{0} / M_{d}(X)\right)}\right),
$$

where $\left\{H_{a}\right\} \subset H_{\mathbb{T}^{N}}^{2}\left(X_{M}^{\tau}\right)$ is a basis whose restriction to $H^{2}\left(X_{M N}^{\tau}\right)$ is a basis of first Chern classes of ample line bundles; see LLY3, Section 3,viii]. By [LLY3, Lemma 3.5],

$$
e_{G}\left(F_{0} / M_{d}(X)\right)=\alpha\left(\alpha-c_{1}\left(L_{d}\right)\right) .
$$

Thus, in our notation,

$$
\begin{equation*}
A(t)=\mathrm{e}^{-H \cdot t / \hbar}\left\{\frac{\mathbf{e}\left(E^{+}\right)}{\mathbf{e}\left(E^{-}\right)}+\sum_{\mathrm{d} \in \Lambda-0} \mathrm{e}^{\mathrm{d} \cdot t} \mathrm{ev}_{1 *}\left[\frac{\mathbf{e}\left(\mathcal{V}_{E}\right)}{\hbar\left(\hbar+\psi_{1}\right)}\right]\right\} \tag{A.1}
\end{equation*}
$$

where $\mathrm{ev}_{1}: \overline{\mathfrak{M}}_{0,1}\left(X_{M}^{\tau}, \mathbf{d}\right) \longrightarrow X_{M}^{\tau}$ is the evaluation map at the marked point. By (4.2), (A.1), and the string relation MirSym, Section 26.3],

$$
\begin{equation*}
A(t)=\mathrm{e}^{-H \cdot t / \hbar} \frac{\mathbf{e}\left(E^{+}\right)}{\mathbf{e}\left(E^{-}\right)} \dot{\mathcal{Z}}_{1}\left(-\hbar, e^{t}\right) \tag{A.2}
\end{equation*}
$$

By (4.7), Remark 5.1, and (4.4), (5.2) is independent of the choice of a $\mathbb{Q}[\alpha]$-basis for $H_{\mathbb{T}^{N}}^{2}\left(X_{M}^{\tau}\right)$ and so it is not necessary to assume that the restrictions of $x_{i}$ to $H^{2}\left(X_{M}^{\tau}\right)$ are Chern classes of ample line bundles. Thus, we may take $H=\left(x_{1}, \ldots, x_{k}\right)$ in [LLY3]. By LLY3, (5.2)] and [LLY3, Theorem 4.9],

$$
\begin{equation*}
B(t)=\mathrm{e}^{-H \cdot t / \hbar} \frac{\mathbf{e}\left(E^{+}\right)}{\mathbf{e}\left(E^{-}\right)} \dot{\mathcal{Y}}\left(x,-\hbar, \mathrm{e}^{t}\right) \tag{A.3}
\end{equation*}
$$

in [LY33, Theorem 4.7]. In the notation of the proof of LLY3, Theorem 4.7] correlated with Remark 5.1 ,

$$
\begin{gather*}
C=\dot{I}_{\mathbf{0}}(q), \quad C^{\prime}=-\dot{I}_{\mathbf{0}}(q)\left(G(q)+\sum_{j=1}^{N} \alpha_{j} g_{j}(q)\right), \quad C^{\prime \prime}=-\dot{I}_{\mathbf{0}}(q) \cdot\left(f_{1}(q), \ldots, f_{k}(q)\right), \\
\mathrm{e}^{f / \alpha}=\mathrm{e}^{-\log C-\frac{C^{\prime}}{C \alpha}}=\frac{1}{\dot{I}_{\mathbf{0}}(q)} \mathrm{e}^{\frac{1}{\hbar}\left[G(q)+\sum_{j=1}^{N} \alpha_{j} g_{j}(q)\right]}, \quad g=-\frac{C^{\prime \prime}}{C}=\left(f_{1}(q), \ldots, f_{k}(q)\right) . \tag{A.4}
\end{gather*}
$$

Finally, by [LY3, Section 5.2] and [LY3, Corollary 4.11], the hypothesis of [LY3, Theorem 4.7] are satisfied with $A(t)$ and $B(t)$ as in (A.2) and (A.3) if $\nu_{E}(\mathbf{d}) \geqslant 0$ for all $\mathbf{d} \in \Lambda$, since $\mathbf{e}\left(E^{+}\right)$and $\mathbf{e}\left(E^{-}\right)$are non-zero whenever restricted to any $\mathbb{T}^{N}$-fixed point; see Proposition 2.21)(a). Thus, (5.2) follows from LLY3, Theorem 4.7], (A.2), (A.3), and (A.4).

[^0]:    ${ }^{1}$ Recall that a line bundle $L \longrightarrow X_{M}^{\tau}$ is called positive (respectively negative) if $c_{1}(L) \in H^{2}\left(X_{M}^{\tau} ; \mathbb{R}\right)$ (respectively $-c_{1}(L)$ ) can be represented by a Kähler form on $X_{M}^{\tau}$. A line bundle $L \longrightarrow X_{M}^{\tau}$ is called non-negative if $c_{1}(L) \in H^{2}\left(X_{M}^{\tau} ; \mathbb{R}\right)$ can be represented by a 2 -form $\omega$ satisfying $\omega(v, J v) \geqslant 0$ for all $v$. The assumptions that the line bundles $L_{i}^{+}$are non-trivial and that $L_{i}^{-}$are negative (that is, $c_{1}\left(L_{i}^{-}\right)<0$ as opposed to just $c_{1}\left(L_{i}^{-}\right) \leqslant 0$ ) are only used in the theorems that rely on the one-point mirror theorem (5.2) of [LLY3], that is Theorem 3.5, Corollary 3.7 Corollary 3.8, Theorem 4.7, Corollary 4.8, and Corollary 4.9,
    ${ }^{2} \mathrm{By}$ [Br, Theorem 4.5], a non-empty closed convex subset of $\mathbb{R}^{d}$ is the intersection of its supporting halfspaces. The supporting half-spaces of a closed convex cone $C$ in $\mathbb{R}^{d}$ are all sets of the form $\left\{v \in \mathbb{R}^{d}:\langle v, w\rangle \geqslant 0\right\}$ for some $w \in \mathbb{R}^{d}$ such that $\langle v, w\rangle \geqslant 0$ for all $v \in C$. This implies that

    $$
    \omega \in \overline{\mathcal{K}}_{M}^{\tau} \quad \Longleftrightarrow \quad\langle\omega, \mathbf{d}\rangle \geqslant 0 \quad \forall \mathbf{d} \in \Lambda .
    $$

[^1]:    ${ }^{3}$ By (1.5) and (2.20), $\nu_{E}(\mathbf{d})=\left\langle c_{1}\left(T\left(\left.E^{-}\right|_{Y}\right)\right), \mathbf{d}\right\rangle$ if $Y$ is a smooth complete intersection defined by a holomorphic section of $E^{+}$and $T\left(\left.E^{-}\right|_{Y}\right)$ is the tangent bundle of the total space of $\left.E^{-}\right|_{Y}$.
    ${ }^{4}$ In the notation of La], $N^{1}\left(X_{M}^{\tau}\right)_{\mathbb{R}}=H^{1,1}\left(X_{M}^{\tau}\right) \cap H^{2}\left(X_{M}^{\tau} ; \mathbb{R}\right)$ as can be seen from Poincaré Duality, Lefschetz Theorem on (1,1)-classes, and Hard Lefschetz Theorem.

[^2]:    ${ }^{5}$ In this case, $f_{i}(q)=\ell_{i 1}^{-} f_{0}(q)$ with $\ell_{i 1}^{-} \in \mathbb{Z}$ given by (3.5).

[^3]:    ${ }^{6}$ Furthermore, $g_{j}=0$ if $b>0$ or $D_{j}(\mathbf{d}) \in\{-1,0\}$ for all $\mathbf{d} \in \Lambda$ with $\nu_{E}(\mathbf{d})=0$.

[^4]:    ${ }^{7}$ See Appendix A for the correspondence between the relevant notation in LLY3] and ours and detailed references within [LY3] indicating how LLY3, Theorem 4.7] together with [LLY3, Section 5.2] implies (5.2).
