We have, as $\epsilon \rightarrow 0$,

$$(M^n \times F^m, \widetilde{dvol_{g_\epsilon}}) \xrightarrow{\text{mGH}} (M^n, e^{-f} dvol_{g_M}),$$

where $g_\epsilon = g_M + (\epsilon e^{-\frac{f}{m}})^2 g_F$.

By O'Neill's formula, the Ricci curvature of the warped product metric g_ϵ in the M direction is

$$\text{Ric}_M + \text{Hess}f - \frac{1}{m} df \otimes df.$$

Guofang Wei

Introduction

Comparison
Geometry for
Bakry-Emery
Ricci Tensor

Comparison
Theorems
Applications
Idea of Proof

Rigidity of
Quasi-Einstein
Metrics

Therefore for smooth metric measure spaces $(M^n, g, e^{-f} d\text{vol}_g)$, the corresponding Ricci tensor is

$$\text{Ric}_f^m = \text{Ric} + \text{Hess}f - \frac{1}{m}df \otimes df \quad \text{for } m > 0,$$

— the m -Bakry-Emery Ricci tensor.

When $m = \infty$, denote $\text{Ric}_f = \text{Ric}_f^\infty = \text{Ric} + \text{Hess}f$

If $m_1 \geq m_2$, then $\text{Ric}_f^{m_1} \geq \text{Ric}_f^{m_2}$.

So $\text{Ric}_f^m \geq \lambda g$ implies $\text{Ric}_f \geq \lambda g$.

Question

What geometric and topological results for the Ricci tensor extend to the Bakry-Emery Ricci tensor?

When $0 < m < \infty$, many geometry and topology results for Ricci curvature lower bound **extend directly** to Ric_f^m (Bakry1994, Qian1997, Lott2003, Bakry-Qian2005,...)

Lott 2003: if M is compact with $\text{Ric}_f^m \geq \lambda$ (m positive integers), then $M \times_{\epsilon e^{-\frac{f}{m}}} \mathbb{S}^m$ has $\text{Ric} \geq \lambda$ when ϵ is small.

Metrics

A main tool for Ricci curvature is the **Bochner formula**:
For smooth function u on (M^n, g) ,

$$\frac{1}{2}\Delta|\nabla u|^2 = |\text{Hess } u|^2 + \langle \nabla u, \nabla(\Delta u) \rangle + \text{Ric}(\nabla u, \nabla u).$$

Using the Cauchy-Schwarz inequality, if $\text{Ric} \geq (n-1)H$,

$$\frac{1}{2}\Delta|\nabla u|^2 \geq \frac{(\Delta u)^2}{n} + \langle \nabla u, \nabla(\Delta u) \rangle + (n-1)H|\nabla u|^2.$$

This characterizes Ricci curvature lower bound.

Idea of Proof

Rigidity of
Quasi-Einstein
Metrics

With respect to the measure $e^{-f} dvol$, $\Delta_f = \Delta - \nabla f \cdot \nabla$:

$$\frac{1}{2} \Delta_f |\nabla u|^2 = |\text{Hess } u|^2 + \langle \nabla u, \nabla(\Delta_f u) \rangle + \text{Ric}_f^m(\nabla u, \nabla u) + \frac{1}{m} |\langle \nabla f, \nabla u \rangle|^2.$$

When m is finite

$$\frac{1}{2} \Delta_f |\nabla u|^2 \geq \frac{(\Delta_f(u))^2}{m+n} + \langle \nabla u, \nabla(\Delta_f u) \rangle + \text{Ric}_f^m(\nabla u, \nabla u).$$

Therefore, (Bakry-Qian2005) if $\text{Ric}_f^m \geq (n+m-1)H$, then

$$m_f(r) \leq m_H^{n+m}(r).$$

When $m = \infty$, we have

$$\frac{1}{2} \Delta_f |\nabla u|^2 = |\text{Hess } u|^2 + \langle \nabla u, \nabla (\Delta_f u) \rangle + \text{Ric}_f(\nabla u, \nabla u).$$

When $m = \infty$, we have

$$\frac{1}{2} \Delta_f |\nabla u|^2 = |\text{Hess } u|^2 + \langle \nabla u, \nabla(\Delta_f u) \rangle + \text{Ric}_f(\nabla u, \nabla u).$$

We start from the usual Riccati inequality

$$m' \leq -\frac{m^2}{n-1} - \text{Ric}(\partial r, \partial r).$$

Let $\text{sn}_H(r)$ be the solution to

$$\text{sn}_H'' + H \text{sn}_H = 0$$

such that $\text{sn}_H(0) = 0$ and $\text{sn}_H'(0) = 1$.

We compute that

$$(\operatorname{sn}_H^2 m - \operatorname{sn}_H^2 m_H)' \leq \operatorname{sn}_H^2 \partial_t \partial_t f,$$

which gives

$$\operatorname{sn}_H^2(r) (m(r) - m_H(r)) \leq \int_0^r \operatorname{sn}_H^2(t) \partial_t \partial_t f(t) dt.$$

We compute that

$$(\operatorname{sn}_H^2 m - \operatorname{sn}_H^2 m_H)' \leq \operatorname{sn}_H^2 \partial_t \partial_t f,$$

which gives

$$\operatorname{sn}_H^2(r) (m(r) - m_H(r)) \leq \int_0^r \operatorname{sn}_H^2(t) \partial_t \partial_t f(t) dt.$$

When f is constant (the classical case) this gives the usual mean curvature comparison.

$$R \geq \frac{n(n-1)}{m+n-1}\lambda.$$

Equality if and only if $m = 1$.

b) if $\lambda = 0$, R is constant and $m > 1$, then it is Ricci flat.

c) if $\lambda < 0$, R is constant, then

$$n\lambda \leq R \leq \frac{n(n-1)}{m+n-1}\lambda,$$

and when $m > 1$, R equals either of the extreme values iff it is Einstein.

When $m = \infty$ this is done in Petersen-Wylie.

When $m = 1$, then R is constant and equals $(n - 1)\lambda$.
