## MAT 320: Introduction to Analysis, Spring 2019 Homework Assignment 10

Please study Ross's Section 27 and Rudin's pp159-165 before starting on the problem set below.

Problem Set 10 (due at the start of recitation on Wednesday, 5/1): 26.8<sup>\*</sup>, 27.2, Problems T-V (below and next page); \*in (a), (1)<sup>n</sup> should be  $(-1)^n$ 

## Problem T

Let X be a set and  $(Y, d_Y)$  be a metric space. Denote by  $\mathcal{M}(X, Y)$  the set of all functions from X to Y. Define

$$d: \mathcal{M}(X,Y)^2 \longrightarrow \mathbb{R}, \qquad d(f,g) = \sup_{x \in X} \min(d_Y(f(x),g(x)),1).$$

Show that

- (a) d is well-defined (takes values in  $\mathbb{R}$ ) and is a metric on  $\mathcal{M}(X, Y)$ ;
- (b) a sequence of functions  $f_n \in \mathcal{M}(X, Y)$  converges uniformly to  $f \in \mathcal{M}(X, Y)$  if and only if  $f_n$  converges to f with respect to the metric d;
- (c) the uniform closure  $\overline{\mathcal{A}}$  of any subcollection  $\mathcal{A} \subset \mathcal{M}(X, Y)$ , as defined in class (and on p161 in Rudin), is uniformly closed, i.e.  $\overline{\overline{\mathcal{A}}} = \overline{\mathcal{A}}$ .

*Hint:* (c) can be obtained from basic properties of metric spaces via (b) or by unwinding the relevant definitions; the former would be about a line.

## Problem U

Let  $S^1 \subset \mathbb{C}$  be the unit circle centered at  $0 \in \mathbb{C}$  with a metric obtained by restricting a standard metric on  $\mathbb{C}$  and

$$q: \mathbb{R} \longrightarrow S^1, \qquad q(t) = e^{2\pi i t}$$

Denote by  $\mathcal{C}(S^1; \mathbb{C})$  the vector space of continuous  $\mathbb{C}$ -valued functions and by  $\mathcal{P}_1(\mathbb{R}; \mathbb{C})$  the vector space of continuous 1-periodic functions  $\tilde{f}$  on  $\mathbb{R}$ , i.e.  $\tilde{f}(t+1) = \tilde{f}(t)$  for all  $t \in \mathbb{R}$ . Show that

- (a) the map q is continuous,  $f \circ q \in \mathcal{P}_1(\mathbb{R}; \mathbb{C})$  for every  $f \in \mathcal{C}(S^1; \mathbb{C})$ , and for every  $\tilde{f} \in \mathcal{P}_1(\mathbb{R}; \mathbb{C})$  there exists a unique  $f \in \mathcal{C}(S^1; \mathbb{C})$  such that  $\tilde{f} = f \circ q$ ;
- (b) for every  $\tilde{f} \in \mathcal{P}_1(\mathbb{R}; \mathbb{C})$  and every  $\epsilon > 0$  there exist  $N \in \mathbb{Z}^+$  and  $a_n \in \mathbb{C}$  with  $n \in \mathbb{Z}$  such that

$$\left|\widetilde{f}(t) - \sum_{n=-N}^{n=N} a_n \mathrm{e}^{2\pi \mathrm{i} \, nt}\right| \le \epsilon \qquad \forall \ t \in \mathbb{R}.$$

*Hint:* apply Rudin's Theorem 7.33 via part (a).

## Problem V

Let  $\mathcal{P}_1(\mathbb{R};\mathbb{C})$  be as in Problem U. For  $f, g \in \mathcal{P}_1(\mathbb{R};\mathbb{C})$  and  $n \in \mathbb{Z}$ , define

$$\langle\!\langle f,g \rangle\!\rangle_2 = \int_0^1 f \overline{g} \, \mathrm{d}t \in \mathbb{C}, \qquad c_n(f) = \langle\!\langle f,\mathrm{e}^{2\pi\mathrm{i}\,nt} \rangle\!\rangle_2.$$

(a) Show that the collection  $\{e^{2\pi i nt} : n \in \mathbb{Z}^+\}$  consists of orthonormal elements of the Hermitian vector space  $(\mathcal{P}_1(\mathbb{R};\mathbb{C}), \langle\!\langle\cdot,\cdot\rangle\!\rangle_2)$ , i.e.

$$\langle\!\langle \mathbf{e}^{2\pi \mathbf{i}\,mt}, \mathbf{e}^{2\pi \mathbf{i}\,nt} \rangle\!\rangle_2 = \begin{cases} 1, & \text{if } m = n; \\ 0, & \text{if } m \neq n. \end{cases}$$

(b) Suppose  $f \in \mathcal{P}_1(\mathbb{R}; \mathbb{C})$  is twice continuously differentiable. Show that

$$c_n(f) = \frac{1}{2\pi \mathfrak{i} n} c_n(f') = -\frac{1}{4\pi^2 n^2} c_n(f'') \qquad \forall \ n \neq 0$$

and that the sum

$$\sum_{n \in \mathbb{Z}} c_n(f) e^{2\pi i nt} \equiv \lim_{k,m \to \infty} \sum_{n=-k}^{n=m} c_n(f) e^{2\pi i nt}$$

converges uniformly to a continuous function  $h_f: \mathbb{R} \longrightarrow \mathbb{C}$  with  $c_n(h_f) = c_n(f)$  for all  $n \in \mathbb{Z}$ .

(c) Suppose  $f \in \mathcal{P}_1(\mathbb{R}; \mathbb{C})$  is twice continuously differentiable. Show that

$$f(t) = \sum_{n \in \mathbb{Z}} c_n(f) e^{2\pi i nt} \qquad \forall \ t \in \mathbb{R}$$

with the sum converging uniformly on  $\mathbb{R}$ .

*Hint:* for the first statement in (b), use integration by parts; for (c), show that  $||f - h_f||_2^2 = 0$  by applying the conclusion of Problem U(b) to  $\tilde{f} = f - h_f$  and using the Cauchy-Schwartz inequality

$$\langle\!\langle \widetilde{f},g\rangle\!\rangle_2 \le \|f\|_2 \|g\|_2$$

which holds for all Hermitian vector spaces.

*Note:* This says that the Fourier series of a function f as in (c) converges to f uniformly on  $\mathbb{R}$ . If f is smooth, then a similar argument shows that

$$\frac{\mathrm{d}^{\ell}}{\mathrm{d}t^{\ell}}f = \sum_{n \in \mathbb{Z}} \left(2\pi \mathrm{i}n\right)^{\ell} c_n(f) \mathrm{e}^{2\pi \mathrm{i}\,nt} \equiv \lim_{k,m \to \infty} \sum_{n=-k}^{n=m} \left(2\pi \mathrm{i}n\right)^{\ell} c_n(f) \mathrm{e}^{2\pi \mathrm{i}\,nt}$$
$$= \lim_{k,m \to \infty} \frac{\mathrm{d}^{\ell}}{\mathrm{d}x^{\ell}} \sum_{n=-k}^{n=m} c_n(f) \mathrm{e}^{2\pi \mathrm{i}\,nt}$$

i.e. the Fourier series of f converges to f uniformly with all derivatives.
