Let (M^n, g) be a Riemannian n-manifold,

Let (M^n, g) be a Riemannian n-manifold, $p \in M$.

Let (M^n, g) be a Riemannian n-manifold, $p \in M$.
Metric defines locally shortest curves, called *geodesics*.

Let (M^n, g) be a Riemannian n-manifold, $p \in M$.
Metric defines locally shortest curves, called *geodesics*.
Following geodesics from p defines a map

$$\exp : T_pM \dashrightarrow M$$

Let (M^n, g) be a Riemannian n-manifold, $p \in M$.
Metric defines locally shortest curves, called *geodesics*.
Following geodesics from p defines a map

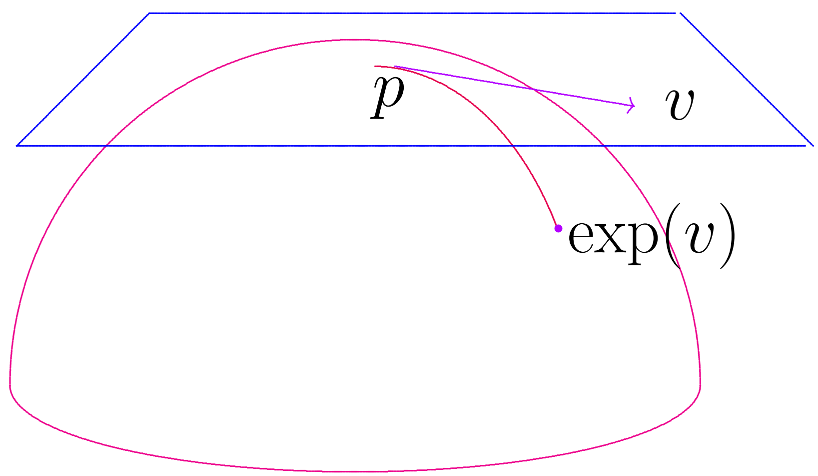
$$\exp : T_pM \longrightarrow M$$

which is a diffeomorphism on a neighborhood of 0:

Let (M^n, g) be a Riemannian n-manifold, $p \in M$.
Metric defines locally shortest curves, called *geodesics*.
Following geodesics from p defines a map

$$\exp : T_pM \longrightarrow M$$

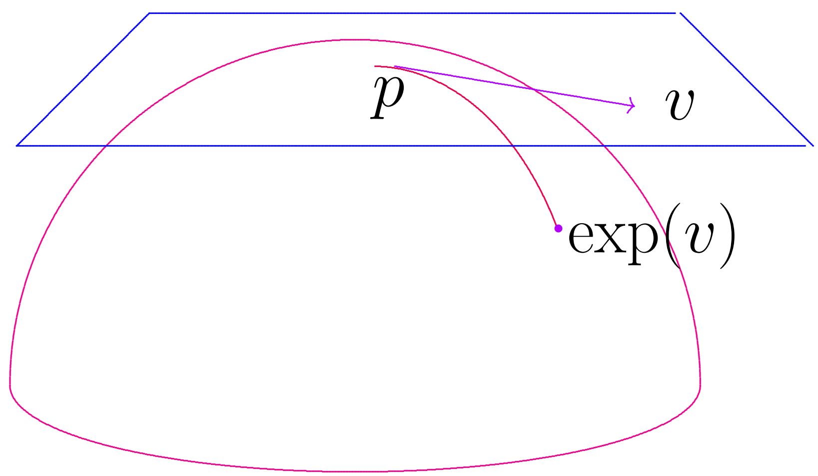
which is a diffeomorphism on a neighborhood of 0:



Let (M^n, g) be a Riemannian n-manifold, $p \in M$.
Metric defines locally shortest curves, called *geodesics*.
Following geodesics from p defines a map

$$\exp : T_pM \longrightarrow M$$

which is a diffeomorphism on a neighborhood of 0:



Now choosing $T_pM \xrightarrow{\cong} \mathbb{R}^n$ via some orthonormal basis gives us special coordinates on M.

In these "geodesic normal" coordinates the metric volume measure is given by

$$d\mu_g = \qquad\qquad d\mu_{\text{Euclidean}},$$

In these "geodesic normal" coordinates the metric volume measure is given by

$$d\mu_g = \left[1 - \qquad\qquad\qquad\qquad\qquad\qquad \right] d\mu_{\text{Euclidean}},$$

In these "geodesic normal" coordinates the metric volume measure is given by

$$d\mu_g = \left[1 - \frac{1}{6}\, r_{jk}\, x^j x^k + \qquad\qquad \right] d\mu_{\text{Euclidean}},$$

In these "geodesic normal" coordinates the metric volume measure is given by

$$d\mu_g = \left[1 - \frac{1}{6}\, r_{jk}\, x^j x^k + O(|x|^3)\right] d\mu_{\text{Euclidean}},$$

In these "geodesic normal" coordinates the metric volume measure is given by

$$d\mu_g = \left[1 - \frac{1}{6}\, r_{jk}\, x^j x^k + O(|x|^3)\right] d\mu_{\text{Euclidean}},$$

where r is the *Ricci tensor*

In these "geodesic normal" coordinates the metric volume measure is given by

$$d\mu_g = \left[1 - \tfrac{1}{6}\, r_{jk}\, x^j x^k + O(|x|^3)\right] d\mu_{\text{Euclidean}},$$

where r is the *Ricci tensor* $r_{jk} = \mathcal{R}^i{}_{jik}$.

In these “geodesic normal” coordinates the metric volume measure is given by

$$d\mu_g = \left[1 - \frac{1}{6}\, r_{jk}\, x^j x^k + O(|x|^3)\right] d\mu_{\text{Euclidean}},$$

where r is the *Ricci tensor* $r_{jk} = \mathcal{R}^i{}_{jik}$.

The *Ricci curvature*

In these "geodesic normal" coordinates the metric volume measure is given by

$$d\mu_g = \left[1 - \frac{1}{6}\, r_{jk}\, x^j x^k + O(|x|^3)\right] d\mu_{\text{Euclidean}},$$

where r is the *Ricci tensor* $r_{jk} = \mathcal{R}^i{}_{jik}$.

The *Ricci curvature* is by definition the function on the unit tangent bundle

In these "geodesic normal" coordinates the metric volume measure is given by

Acknowledgements

Pour rassembler les éléments un peu disparates qui constituent ce livre, j'ai dû faire appel à de nombreux amis, heureusement bien plus savants que moi. Ce sont, entre autres, Geneviève Averous, Lionel Bérard-Bergery, Marcel Berger, Jean-Pierre Bourguignon, Andrei Derdzinski, Dennis M. DeTurck, Paul Gauduchon, Nigel J. Hitchin, Josette Houillot, Hermann Karcher, Jerry L. Kazdan, Norihito Koiso, Jacques Lafontaine, Pierre Pansu, Albert Polombo, John A. Thorpe, Liane Valère.

Les institutions suivantes m'ont prêté leur concours matériel, et je les en remercie: l'UER de mathématiques de Paris 7, le Centre de Mathématiques de l'Ecole Polytechnique, Unités Associées du CNRS, l'UER de mathématiques de Chambéry et le Conseil Général de Savoie.

Enfin, qu'il me soit permis de saluer ici mon prédecesseur et homonyme Jean Besse, de Zürich, qui s'est illustré dans la théorie des fonctions d'une variable complexe (voir par exemple [Bse]).

Einstein Manifolds

Springer-Verlag Berlin Heidelberg GmbH

The book's Introduction concludes as follows:

The book's Introduction concludes as follows:

"Can Einstein metrics with [Einstein] constants of opposite signs exist on the same manifold?"

The book's Introduction concludes as follows:

"Can Einstein metrics with [Einstein] constants of opposite signs exist on the same manifold?
If this is impossible, it would add weight to the remark. . . that positive and negative Einstein metrics belong to essentially distinct families."

The book's Introduction concludes as follows:

"Can Einstein metrics with [Einstein] constants of opposite signs exist on the same manifold? If this is impossible, it would add weight to the remark. . . that positive and negative Einstein metrics belong to essentially distinct families."

— A.L. Besse, *Einstein Manifolds*, p. 19

"Can Einstein metrics with [Einstein] constants of opposite signs exist on the same manifold?"

— A.L. Besse, *Einstein Manifolds*, p. 19

"Can Einstein metrics with [Einstein] constants of opposite signs exist on the same manifold?"

— A.L. Besse, *Einstein Manifolds*, p. 19

Became a folk-conjecture that the answer is No.

“Can Einstein metrics with [Einstein] constants of opposite signs exist on the same manifold?”

— A.L. Besse, *Einstein Manifolds*, p. 19

Became a folk-conjecture that the answer is No.

But it turns out that the answer is actually Yes!

Theorem (Catanese-L 1997). *For each* $k \geq 2$*, there is a closed simply-connected* $4k$*-manifold* M *that admits both* $\lambda > 0$ *and* $\lambda < 0$ *Einstein metrics.*

Ingredients:

- geography of complex surfaces;
- complex deformation theory;
- theory of Kähler-Einstein metrics;
- h-cobordisms of 4-manifolds; and
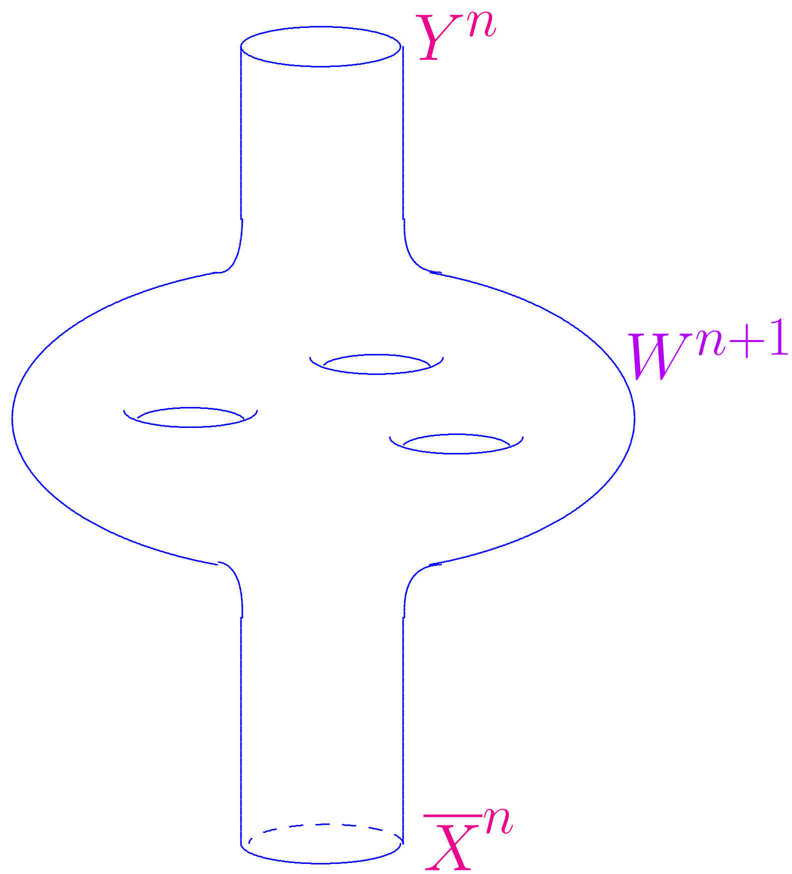
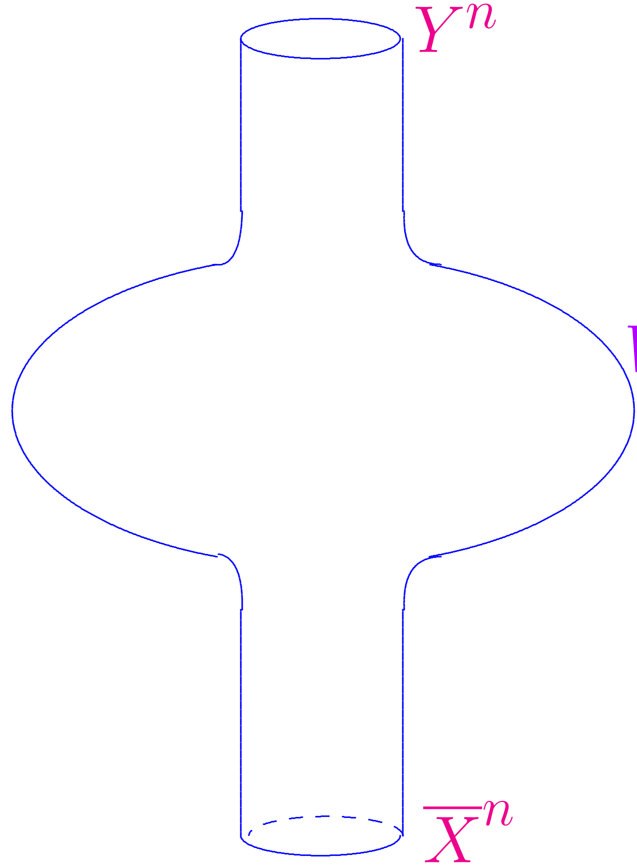
- Smale's h-cobordism theorem.

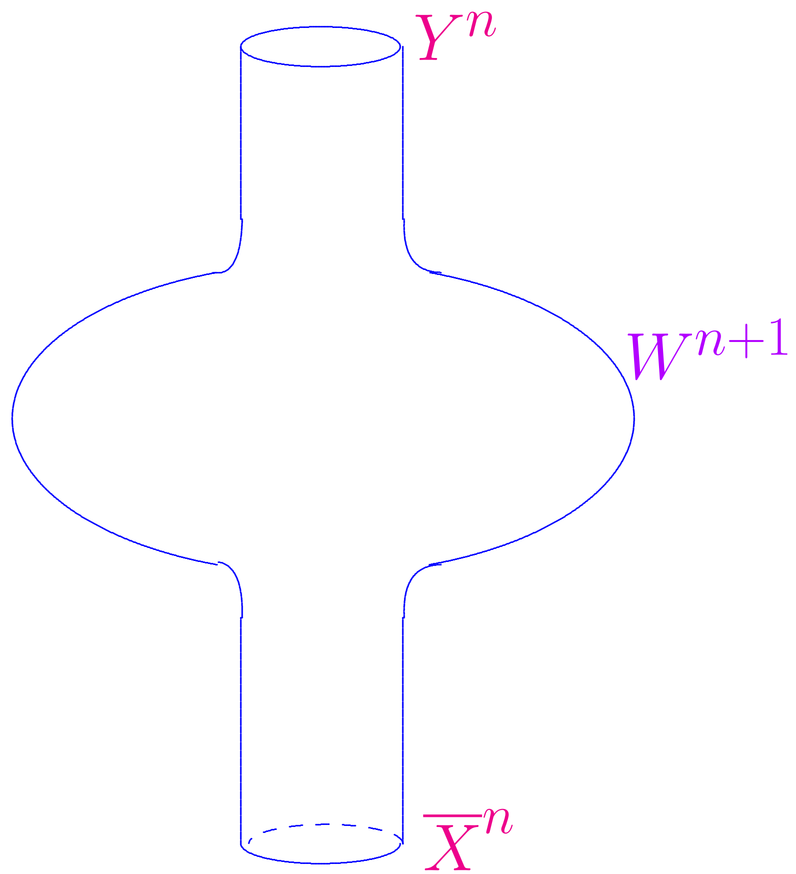


Cobordism

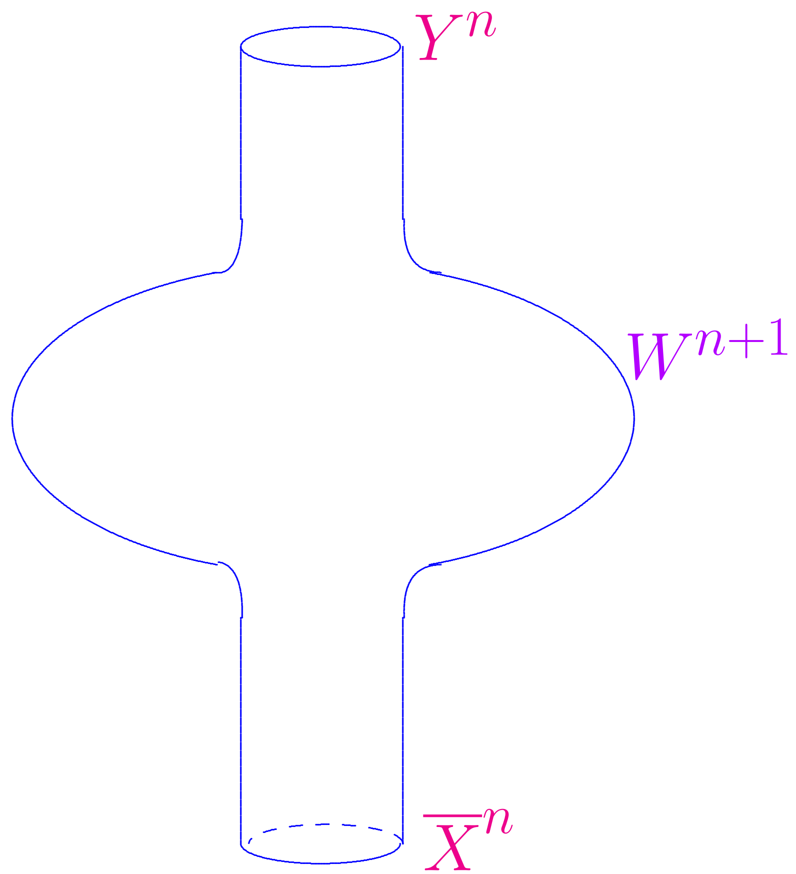


h-Cobordism

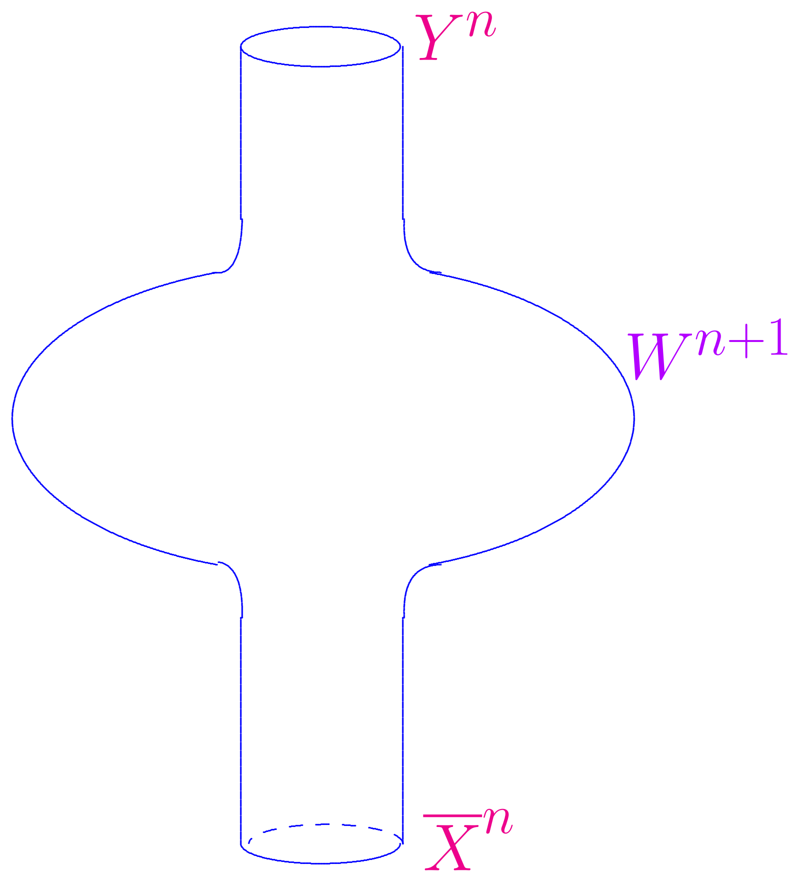
if $X \hookrightarrow W$, $Y \hookrightarrow W$ both homotopy equivalences



Smale: Suppose that X^n is h-cobordant to Y^n. If $\pi_1 = 0$ and $n > 4$, then X is diffeomorphic to Y.

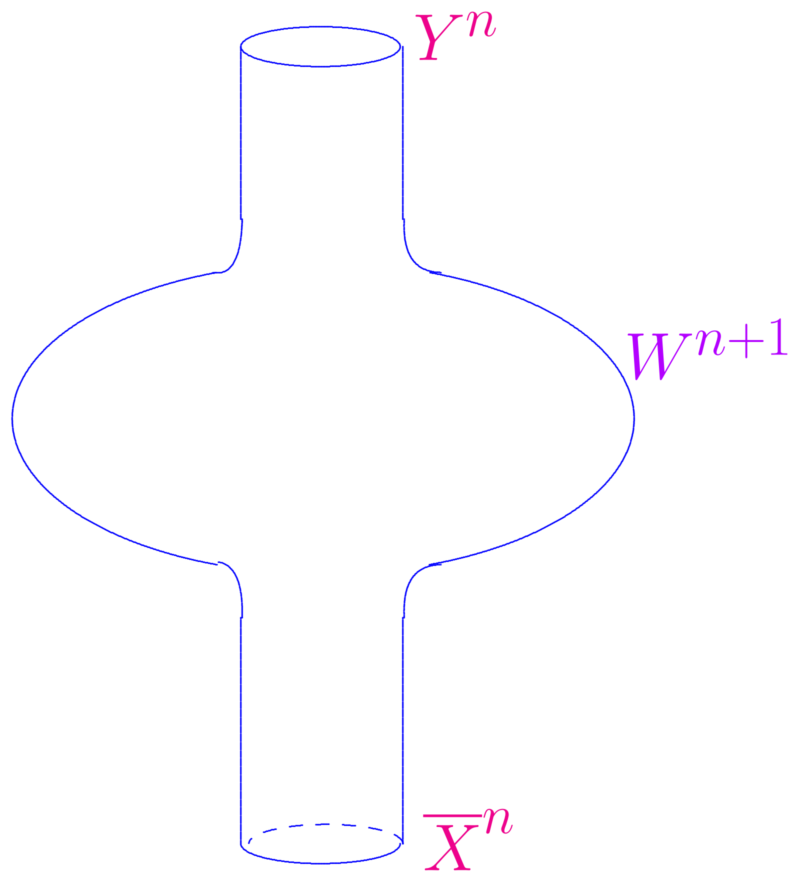


Wall: Suppose that X^4 homotopy equivalent to Y^4.
If $\pi_1 = 0$, then X is h-cobordant to Y.

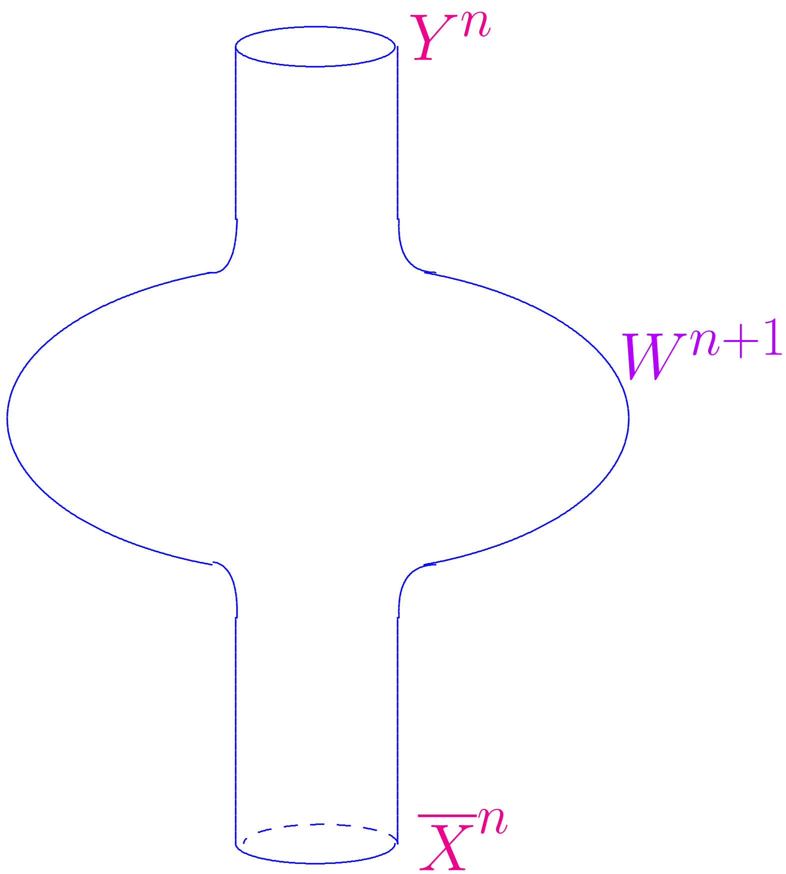


Wall: Suppose that X^4 homotopy equivalent to Y^4.
If $\pi_1 = 0$, then X is h-cobordant to Y.

But Smale doesn't apply when $n = 4$!

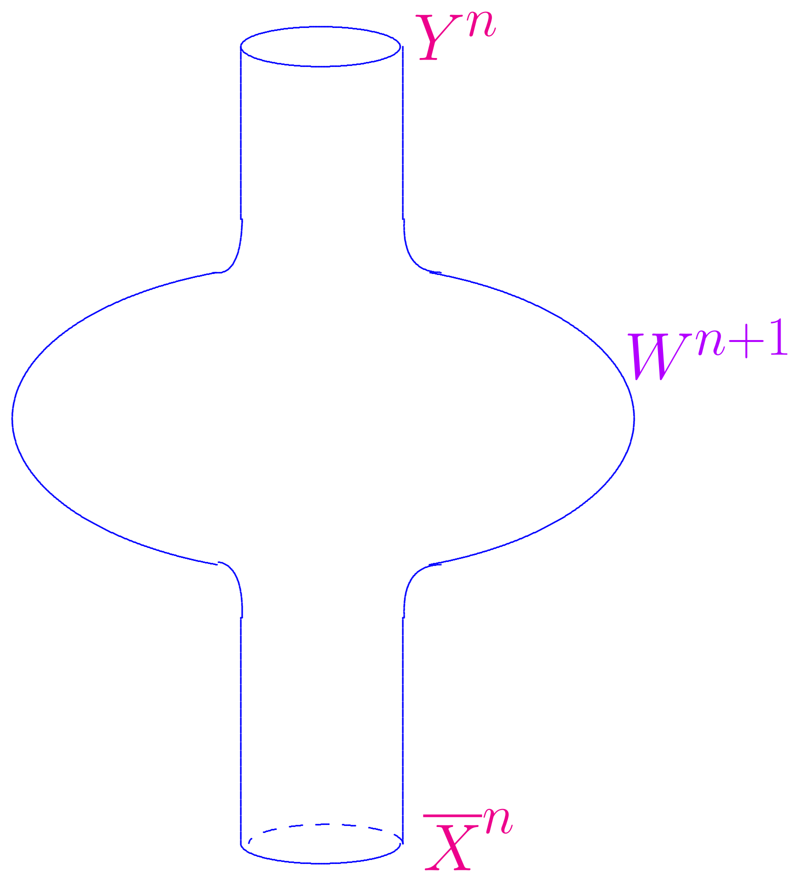


However, we still do get . . .



However, we still do get ...

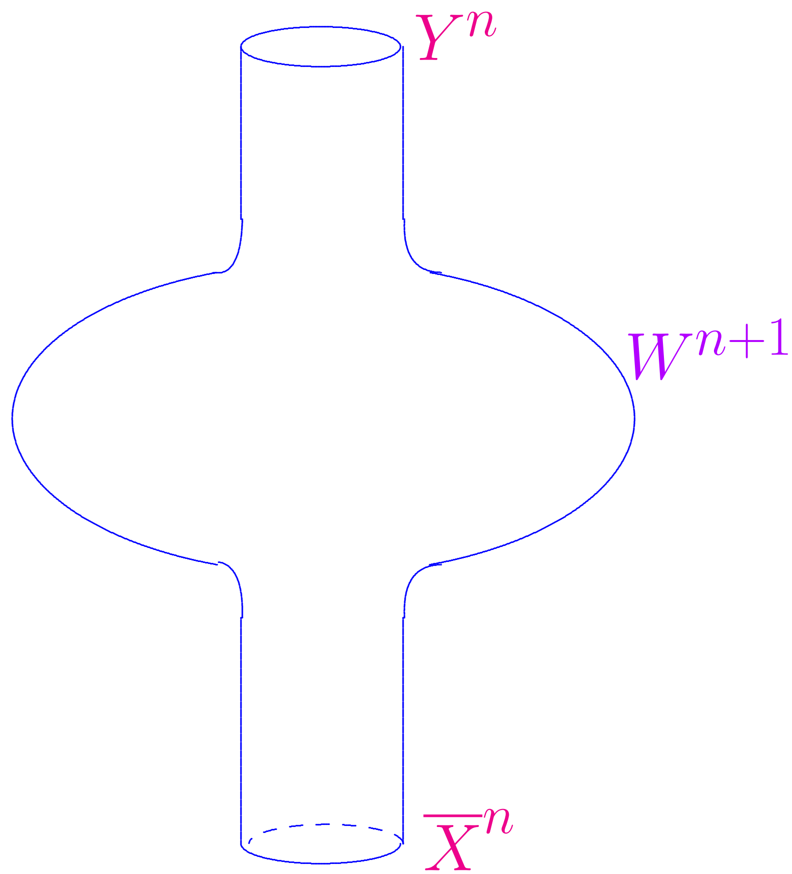
Lemma. *If X^4 and Y^4 are homotopy equivalent and simply connected, then $X \times X$ is actually diffeomorphic to $Y \times Y$.*



Indeed, if W is h-cobordism $X \sim Y$, then

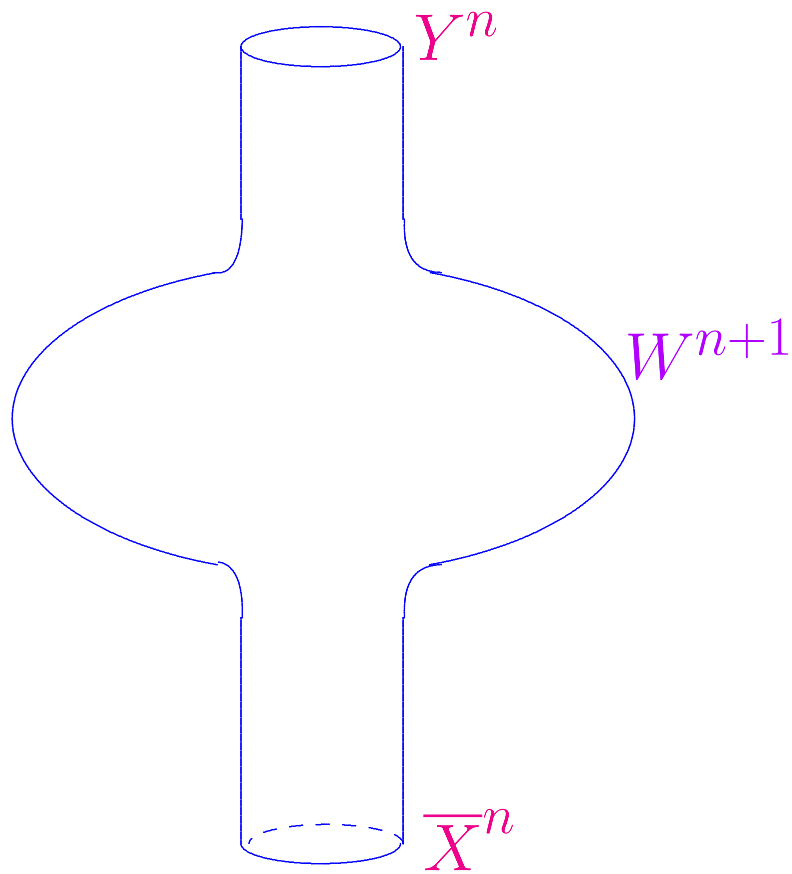
$$(X \times W) \cup_{X \times Y} (W \times Y)$$

is an h-cobordism $(X \times X) \sim (Y \times Y)$.



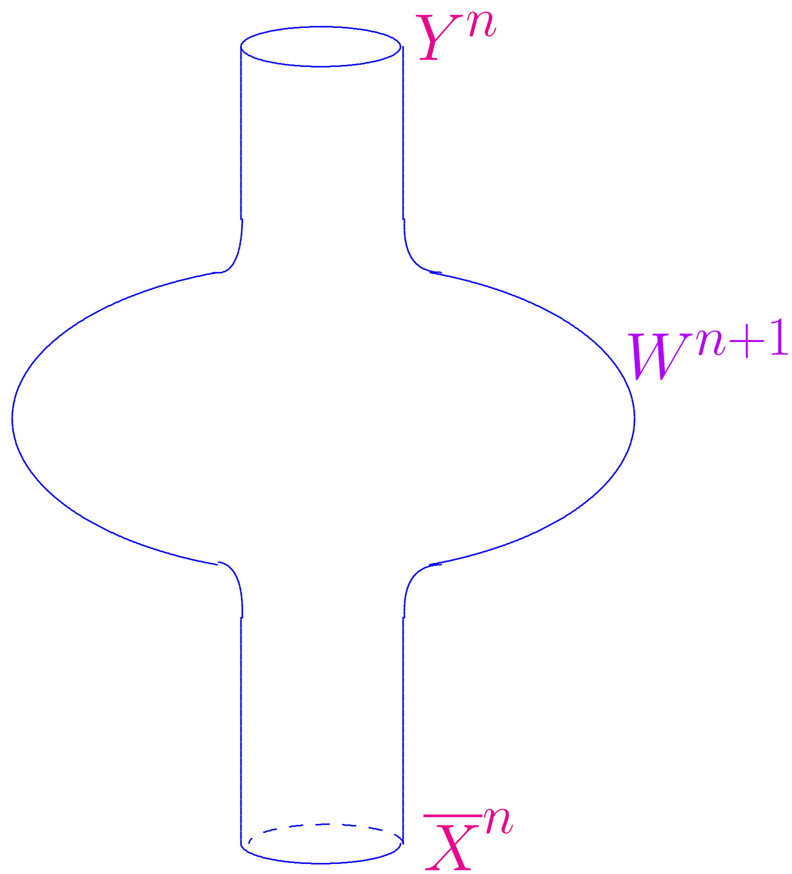
Lemma. *If* X^4 *and* Y^4 *are homotopy equivalent and simply connected, then*

$$\underbrace{X \times \cdots \times X}_{k} \approx_{\mathsf{diff}} \underbrace{Y \times \cdots \times Y}_{k}$$



Lemma. *If X^4 and Y^4 are homotopy equivalent and simply connected, then*

$$\underbrace{X \times \cdots \times X}_{k} \approx_{\mathsf{diff}} \underbrace{Y \times \cdots \times Y}_{k} \qquad \forall k \geq 2.$$



Lemma. *If* X^4 *and* Y^4 *are simply connected, non-spin, with* $\chi(X) = \chi(Y)$, $\tau(X) = \tau(Y)$, *then*

$$\underbrace{X \times \cdots \times X}_{k} \approx_{\mathsf{diff}} \underbrace{Y \times \cdots \times Y}_{k} \qquad \forall k \geq 2.$$

Theorem (Catanese-L 1997). *For each* $k \geq 2$*, there is a closed simply-connected* $4k$*-manifold* M *that admits both* $\lambda > 0$ *and* $\lambda < 0$ *Einstein metrics.*

$\exists$ vast multiverse of Einstein (M^7, g) with $\lambda > 0$.

Sasaki-Einstein 7-manifolds (M^7, g):

Metric cone $(M^7 \times \mathbb{R}^+, dr^2 + r^2 g)$ holonomy $\mathbf{SU}(4)$.

What about odd dimensions?

$\mathbf{G}_2$ is the only irreducible holonomy option.

Holonomy $\mathbf{G}_2 \Longrightarrow (M^7, g)$ Ricci-flat. $(\lambda = 0)$

Constructions of Einstein 7-manifolds of with $\lambda \neq 0$?

$\exists$ vast multiverse of Einstein (M^7, g) with $\lambda > 0$.

Sasaki-Einstein 7-manifolds (M^7, g):

Metric cone $(M^7 \times \mathbb{R}^+, dr^2 + r^2 g)$ is Calabi-Yau.

What about odd dimensions?

$\mathbf{G}_2$ is the only irreducible holonomy option.

Holonomy $\mathbf{G}_2 \Longrightarrow (M^7, g)$ Ricci-flat. $(\lambda = 0)$

Constructions of Einstein 7-manifolds of with $\lambda \neq 0$?

$\exists$ vast multiverse of Einstein (M^7, g) with $\lambda > 0$.

Sasaki-Einstein 7-manifolds (M^7, g):

Metric cone $(M^7 \times \mathbb{R}^+, dr^2 + r^2 g)$ is Calabi-Yau.

Can such metrics coexist?

Alas, no!

Alas, no!

Theorem. *No smooth compact* M^7

Alas, no!

Theorem. *No smooth compact* M^7 *can admit both a Sasaki-Einstein metric* g_1

Alas, no!

Theorem. *No smooth compact* M^7 *can admit both a Sasaki-Einstein metric* g_1 *and a metric* g_2

Alas, no!

Theorem. *No smooth compact M^7 can admit both a Sasaki-Einstein metric g_1 and a metric g_2 with holonomy $\subset \mathbf{G}_2$.*

Alas, no!

Theorem. *No smooth compact M^7 can admit both a Sasaki-Einstein metric g_1 and a metric g_2 with holonomy $\subset \mathbf{G}_2$.*

Key:

Alas, no!

Theorem. *No smooth compact* M^7 *can admit both a Sasaki-Einstein metric* g_1 *and a metric* g_2 *with holonomy* $\subset \mathbf{G}_2$.

Key:

Proposition. *If smooth compact* M^7 *carries a Sasaki-Einstein metric* g_1,

Alas, no!

Theorem. *No smooth compact* M^7 *can admit both a Sasaki-Einstein metric* g_1 *and a metric* g_2 *with holonomy* $\subset \mathbf{G}_2$.

Alas, no!

Theorem. *No smooth compact* M^7 *can admit both a Sasaki-Einstein metric* g_1 *and a metric* g_2 *with holonomy* $\subset \mathbf{G}_2$*.*

Key:

Proposition. *If smooth compact* M^7 *carries a Sasaki-Einstein metric* g_1*, then* $p_1(M) \in H^4(M, \mathbb{Z})$ *is a torsion class.*

To make this plausible,

Alas, no!

Theorem. *No smooth compact* M^7 *can admit both a Sasaki-Einstein metric* g_1 *and a metric* g_2 *with holonomy* $\subset \mathbf{G}_2$.

Key:

Proposition. *If smooth compact* M^7 *carries a Sasaki-Einstein metric* g_1, *then* $p_1(M) \in H^4(M, \mathbb{Z})$ *is a torsion class.*

To make this plausible, will first illustrate assertion for prototypical examples due to S. Kobayashi '63.

Prototypical examples:

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow \\ & & X^6 \end{array}$$

Prototypical examples:

$$\begin{array}{ccc} S^1 & \rightarrow & M^7 \\ & & \downarrow \\ & & X^6 \end{array}$$

(X, h) Kähler-Einstein, $\lambda = 8$.

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow \\ & & X^6 \end{array}$$

(X, h) Kähler-Einstein, $\lambda = 8$.

M unit circle bundle in $K^* = \Lambda^3 T^{1,0} X$.

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow^{\varpi} \\ & & X^6 \end{array}$$

(X, h) Kähler-Einstein, $\lambda = 8$.

M unit circle bundle in $K^* = \Lambda^3 T^{1,0} X$.

ϖ Riemannian submersion.

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow^{\varpi} \\ & & X^6 \end{array}$$

(X, h) Kähler-Einstein, $\lambda = 8$.

M unit circle bundle in $K^* = \Lambda^3 T^{1,0} X$.

ϖ Riemannian submersion.

Horizontal distribution: Chern connection for h.

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow^{\varpi} \\ & & X^6 \end{array}$$

(X, h) Kähler-Einstein, $\lambda = 8$.

M unit circle bundle in $K^* = \Lambda^3 T^{1,0} X$.

ϖ Riemannian submersion.

Horizontal distribution: Chern connection for h.

Fiber circles totally geodesic, of length $\pi/2$.

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow^{\varpi} \\ & & X^6 \end{array}$$

(X, h) Kähler-Einstein, $\lambda = 8$.

M unit circle bundle in $K^* = \Lambda^3 T^{1,0} X$.

ϖ Riemannian submersion.

Horizontal distribution: Chern connection for h.

Fiber circles totally geodesic, of length $\pi/2$.

(M, g) Einstein, $\lambda = 6$.

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow^{\varpi} \\ & & X^6 \end{array}$$

(X, h) Kähler-Einstein, $\lambda = 8$.

M unit circle bundle in $K^* = \Lambda^3 T^{1,0} X$.

ϖ Riemannian submersion.

Horizontal distribution: Chern connection for h.

Fiber circles totally geodesic, of length $\pi/2$.

(M, g) Einstein, $\lambda = 6$. "Sasaki-Einstein."

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow \varpi \\ & & X^6 \end{array}$$

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow^{\varpi} \\ & & X^6 \end{array}$$

Gysin sequence:

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow \varpi \\ & & X^6 \end{array}$$

Gysin sequence:

$$\cdots \to H^k(M) \to H^{k-1}(X) \xrightarrow{\mathsf{L}} H^{k+1}(X) \xrightarrow{\varpi^*} H^{k+1}(M) \to \cdots$$

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow \varpi \\ & & X^6 \end{array}$$

Gysin sequence:

$$\cdots \to H^k(M) \to H^{k-1}(X) \stackrel{\mathsf{L}}{\to} H^{k+1}(X) \stackrel{\varpi^*}{\to} H^{k+1}(M) \to \cdots$$

where L = cup with Euler class $c_1(M)$ of $K^* \to X$.

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow^{\varpi} \\ & & X^6 \end{array}$$

Gysin sequence:

$$\cdots \to H^3(M) \to H^2(X) \xrightarrow{\mathsf{L}} H^4(X) \xrightarrow{\varpi^*} H^4(M) \to \cdots$$

where L = cup with Euler class $c_1(M)$ of $K^* \to X$.

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow^{\varpi} \\ & & X^6 \end{array}$$

Gysin sequence:

$$\cdots \to H^3(M) \to H^2(X) \stackrel{\mathsf{L}}{\to} H^4(X) \stackrel{\varpi^*}{\to} H^4(M) \to \cdots$$

where L = cup with Euler class $c_1(M)$ of $K^* \to X$.

But X is Fano! So L = Lefschetz operator of (X, h).

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow \varpi \\ & & X^6 \end{array}$$

Gysin sequence:

$$\cdots \to H^3(M) \to H^2(X) \xrightarrow{\mathsf{L}} H^4(X) \xrightarrow{\varpi^*} H^4(M) \to \cdots$$

where L = cup with Euler class $c_1(M)$ of $K^* \to X$.

But X is Fano! So L = Lefschetz operator of (X, h).

Hard Lefschetz theorem for (X, h):

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow^{\varpi} \\ & & X^6 \end{array}$$

Gysin sequence:

$$\cdots \to H^3(M) \to H^2(X) \xrightarrow{\mathsf{L}} H^4(X) \xrightarrow{\varpi^*} H^4(M) \to \cdots$$

where L = cup with Euler class $c_1(M)$ of $K^* \to X$.

But X is Fano! So L = Lefschetz operator of (X, h).

Hard Lefschetz theorem for (X, h):

$$\mathsf{L} : H^2(X, \mathbb{R}) \xrightarrow{\cong} H^4(X, \mathbb{R})$$

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow \varpi \\ & & X^6 \end{array}$$

Gysin sequence:

$$\cdots \to H^3(M) \to H^2(X) \stackrel{\cong}{\to} H^4(X) \stackrel{\varpi^*}{\to} H^4(M) \to \cdots$$

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow^{\varpi} \\ & & X^6 \end{array}$$

Gysin sequence:

$$\cdots \to H^3(M) \to H^2(X) \stackrel{\cong}{\to} H^4(X) \stackrel{\varpi^*}{\to} H^4(M) \to \cdots$$

Hence

$$\varpi^* : H^4(X, \mathbb{R}) \stackrel{\cong}{\longrightarrow} H^4(M, \mathbb{R})$$

vanishes!

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow^{\varpi} \\ & & X^6 \end{array}$$

Gysin sequence:

$$\cdots \to H^3(M) \to H^2(X) \stackrel{\cong}{\to} H^4(X) \stackrel{\varpi^*}{\to} H^4(M) \to \cdots$$

Hence

$$\varpi^* : H^4(X, \mathbb{R}) \stackrel{\cong}{\longrightarrow} H^4(M, \mathbb{R})$$

vanishes!

But $p_1(M) = \varpi^* p_1(X)$, because

$$TM \cong \mathbb{R} \oplus \varpi^* TX.$$

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow \varpi \\ & & X^6 \end{array}$$

Gysin sequence:

$$\cdots \to H^3(M) \to H^2(X) \stackrel{\cong}{\to} H^4(X) \stackrel{\varpi^*}{\to} H^4(M) \to \cdots$$

Hence

$$\varpi^* : H^4(X, \mathbb{R}) \xrightarrow{\cong} H^4(M, \mathbb{R})$$

vanishes!

But $p_1(M) = \varpi^* p_1(X)$, because

$$TM \cong \mathbb{R} \oplus \varpi^* TX.$$

So $[p_1(M)]^{\mathbb{R}} \in H^4(M, \mathbb{R})$ vanishes.

Prototypical examples:

$$\begin{array}{ccc} S^1 & \to & M^7 \\ & & \downarrow^{\varpi} \\ & & X^6 \end{array}$$

Gysin sequence:

$$\cdots \to H^3(M) \to H^2(X) \xrightarrow{\mathsf{L}} H^4(X) \xrightarrow{\varpi^*} H^4(M) \to \cdots$$

Hence

$$\varpi^* : H^4(X, \mathbb{R}) \xrightarrow{\cong} H^4(M, \mathbb{R})$$

vanishes!

But $p_1(M) = \varpi^* p_1(X)$, because

$$TM \cong \mathbb{R} \oplus \varpi^* TX.$$

So $p_1(M) \in H^4(M, \mathbb{Z})$ is a torsion element.

Proposition. *If smooth compact* M^7 *carries a Sasaki-Einstein metric* g_1*, then* $p_1(M) \in H^4(M, \mathbb{Z})$ *is a torsion class.*

Proposition. *If smooth compact* M^7 *carries a Sasaki-Einstein metric* g_1*, then* $p_1(M) \in H^4(M, \mathbb{Z})$ *is a torsion class.*

To prove general case, replace $H^*(X, \mathbb{R})$ with the basic cohomology $H^*_B(M, \mathfrak{F})$ of M relative to the Reeb foliation $\mathfrak{F}$.

Proposition. *If smooth compact* M^7 *carries a Sasaki-Einstein metric* g_1*, then* $p_1(M) \in H^4(M, \mathbb{Z})$ *is a torsion class.*

To prove general case, replace $H^*(X, \mathbb{R})$ with the basic cohomology $H^*_B(M, \mathfrak{F})$ of M relative to the Reeb foliation $\mathfrak{F}$.

Replace Hard Lefschetz on $H^*(X, \mathbb{R})$ with transverse version on $H^*_B(M, \mathfrak{F})$ due to El Kacimi-Alaoui.

Proposition. *If smooth compact* M^7 *carries a Sasaki-Einstein metric* g_1*, then* $p_1(M) \in H^4(M, \mathbb{Z})$ *is a torsion class.*

Proposition. *If smooth compact* M^7 *carries a Sasaki-Einstein metric* g_1*, then* $p_1(M) \in H^4(M, \mathbb{Z})$ *is a torsion class.*

By contrast, if (M^7, g_2) has holonomy $\mathbf{G_2}$,

Proposition. *If smooth compact* M^7 *carries a Sasaki-Einstein metric* g_1*, then* $p_1(M) \in H^4(M, \mathbb{Z})$ *is a torsion class.*

By contrast, if (M^7, g_2) has holonomy $\mathbf{G_2}$, then $p_1(M) \in H^4(M, \mathbb{Z})$ can't be a torsion class:

Proposition. *If smooth compact* M^7 *carries a Sasaki-Einstein metric* g_1*, then* $p_1(M) \in H^4(M, \mathbb{Z})$ *is a torsion class.*

By contrast, if (M^7, g_2) has holonomy $\mathbf{G_2}$, then $p_1(M) \in H^4(M, \mathbb{Z})$ can't be a torsion class:

$$\langle p_1(M) \cup [\varphi], [M] \rangle = -\frac{1}{8\pi^2} \int_M |\mathcal{R}|^2 d\mu_{g_2} < 0,$$

Proposition. *If smooth compact* M^7 *carries a Sasaki-Einstein metric* g_1, *then* $p_1(M) \in H^4(M, \mathbb{Z})$ *is a torsion class.*

By contrast, if (M^7, g_2) has holonomy $\mathbf{G_2}$, then $p_1(M) \in H^4(M, \mathbb{Z})$ can't be a torsion class:

$$\langle p_1(M) \cup [\varphi], [M] \rangle = -\frac{1}{8\pi^2} \int_M |\mathcal{R}|^2 d\mu_{g_2} < 0,$$

where $\mathcal{R}$ is Riemann curvature tensor and φ is the parallel 3-form determining g_2.

Proposition. *If smooth compact* M^7 *carries a Sasaki-Einstein metric* g_1*, then* $p_1(M) \in H^4(M, \mathbb{Z})$ *is a torsion class.*

By contrast, if (M^7, g_2) has holonomy $\mathbf{G_2}$, then $p_1(M) \in H^4(M, \mathbb{Z})$ can't be a torsion class:

$$\langle p_1(M) \cup [\varphi], [M] \rangle = -\frac{1}{8\pi^2} \int_M |\mathcal{R}|^2 d\mu_{g_2} < 0,$$

where $\mathcal{R}$ is Riemann curvature tensor and φ is the parallel 3-form determining g_2.

Theorem. *No smooth compact* M^7 *can admit both a Sasaki-Einstein metric* g_1 *and a metric* g_2 *with holonomy* $\subset \mathbf{G}_2$*.*

What about other dimensions?

What about other dimensions?
