

Recall: • Partial derivatives

$$\frac{\partial f}{\partial x} = f_x = \lim_{h \rightarrow 0} \frac{f(x+h, y) - f(x, y)}{h}$$

$$\frac{\partial f}{\partial y} = f_y = \lim_{k \rightarrow 0} \frac{f(x, y+k) - f(x, y)}{k}$$

- Let  $S$  be the graph,  $z = f(x, y)$  if  $S$  has a tangent plane at  $(x, y) = (a, b)$  it is given by

$$f_x(a, b)(x-a) + f_y(a, b)(y-b) - (z - f(a, b)) = 0$$

When does  $z = f(x, y)$  have tangent planes? The answer is:  
when  $f$  is differentiable

Def:  $f$  is differentiable at

$(x, y) = (a, b)$  if when writing

$$f(x, y) = f(a, b) + f_x(a, b)(x-a) + f_y(a, b)(y-b)$$

$+ E(x,y) \leftarrow$  error term

We have

$$\lim_{(x,y) \rightarrow (a,b)} \frac{E(x,y)}{\sqrt{(x-a)^2 + (y-b)^2}} = 0$$

Ex:

$$f(x,y) = \begin{cases} \frac{xy}{\sqrt{x^2+y^2}}, & (x,y) \neq (0,0) \\ 0, & (x,y) = (0,0) \end{cases}$$

Is  $f$  differentiable at the origin?

First let's compute  $f_x(0,0)$ ,  $f_y(0,0)$

Since  $f$  is defined piecewise,  
we need to use the definition.

$$f_x(0,0) = \lim_{h \rightarrow 0} \frac{f(h,0) - f(0,0)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{0}{h} = 0$$

$$f_y(0,0) = [\text{similar limit}] = 0.$$

Now, let's find the error term as in the def of differentiability

$$f(x,y) = \underbrace{f(0,0)}_{=0} + \underbrace{f_x(0,0)x}_{=0} + \underbrace{f_y(0,0)y}_{=0} + E(x,y)$$

$$= E(x,y) = \frac{xy}{\sqrt{x^2+y^2}}$$

$$\lim_{(x,y) \rightarrow (0,0)} \frac{E(x,y)}{\sqrt{x^2+y^2}} = \lim_{(x,y) \rightarrow (0,0)} \frac{xy}{x^2+y^2}$$

and this limit doesn't exist,  
b/c along the line  $y=0$

it is

$$\boxed{y=0} \quad \lim_{(x,y) \rightarrow (0,0)} \frac{0}{x^2} = 0$$

Along the line  $x=y$  it is

$$\boxed{x=y} \quad \lim_{x \rightarrow 0} \frac{x^2}{x^2+x^2} = \lim_{x \rightarrow 0} \frac{1}{2} = \frac{1}{2}$$

Since the limit doesn't exist,  
 $f(x,y)$  is not differentiable

at  $(x,y) = (0,0)$ . But note, that the partial derivatives do exist!

Remark: If  $f$  is differentiable, its partial derivatives exist, but not the other way around.

Ex:  $f(x,y) = xe^{xy}$ . Is differentiable at  $(x,y) = (0,0)$ ?

$$f_x(x,y) = e^{xy} + xye^{xy} = (1+xy)e^{xy}$$

$$f_y(x,y) = x^2e^{xy}$$

$$f(1,0) = 0 \cdot e^0 = 0$$

$$f_x(1,0) = (1+0)e^0 = 1$$

$$f_y(1,0) = 0e^0 = 0$$

$$f(x,y) = \underbrace{f(0,0)}_{=0} + \underbrace{f_x(0,0)x}_{=1} + \underbrace{f_y(0,0)y}_{=0} + E(x,y)$$

$$\Leftrightarrow E(x,y) = f(x,y) - x = xe^{xy} - x$$

$$\lim_{(xy) \rightarrow (0,0)} \frac{xe^{xy} - x}{\sqrt{x^2 + y^2}}. \text{ Does it exist?}$$

Let's try to check the limit along lines  $y=kx$ .

$$\begin{aligned} \lim_{x \rightarrow 0} \frac{xe^{kx^2} - x}{\sqrt{x^2 + k^2 x^2}} &= \lim_{x \rightarrow 0} \frac{xe^{kx^2} - x}{\sqrt{1+k^2} |x|} \\ &= \lim_{x \rightarrow 0} \frac{\text{sgn}(x)}{\sqrt{1+k^2}} \underbrace{(e^{kx^2} - 1)}_{\rightarrow 0} = 0 \end{aligned}$$

We guess that the limit exists, and now we prove it :

$$\text{Remember } \lim_{(x,y) \rightarrow (a,b)} f(x,y) = L$$

if  $|f(x,y) - L|$  can be arbitrarily small by making  $\text{dist}((x,y), (a,b))$  arbitrarily small.

We have  $x \leq \sqrt{x^2 + y^2}$  for  $x, y$  very close to 0. So

$$\left| \frac{x(e^{xy}-1)}{\sqrt{x^2+y^2}} \right| \leq \left| \frac{\sqrt{x^2+y^2}(e^{xy}-1)}{\sqrt{x^2+y^2}} \right|$$

$= |e^{xy}-1| \rightarrow 0$ , which

shows

$$\lim_{(x,y) \rightarrow (0,0)} \frac{xe^{xy}-x}{\sqrt{x^2+y^2}} = 0.$$

---

Ex:  $f(x,y) = x^2+3y$ . Is  $f$  differentiable at every point?

$$f_x(x,y) = 2x, \quad f_y(x,y) = 3.$$

$$f(x,y) = f(a,b) + f_x(a,b)(x-a) + f_y(a,b)(y-b) \\ + E(x,y)$$

$$\Leftrightarrow E(x,y) = f(x,y) - f(a,b) - 2a(x-a) \\ - 3(y-b)$$

$$= x^2 + 3y - a^2 - 3b - 2ax + 2a^2 \\ - 3y + 3b$$

$$= x^2 + a^2 - 2ax = (x-a)^2. \text{ Now}$$

$$\left| \frac{(x-a)^2}{\sqrt{(x-a)^2 + (y-b)^2}} \right| \leq \left| \frac{(x-a)^2}{\sqrt{(x-a)^2}} \right| = |x-a|$$

$\rightarrow 0$  as  $(x,y) \rightarrow (a,b)$ , so  
 $f(x,y)$  is differentiable at every pt.

Thm: If  $f$  is differentiable,  $f$  is continuous.

### §4.5 Chain rule

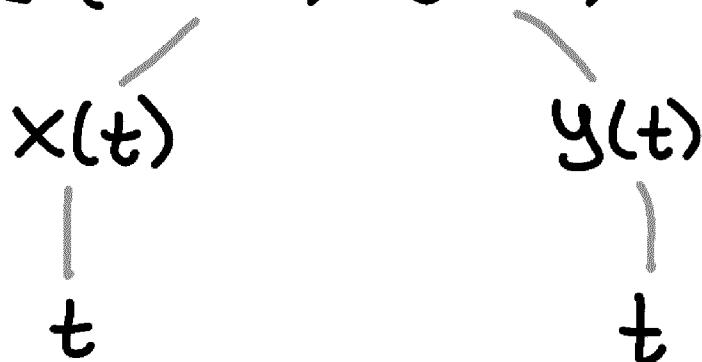

Chain rule in a single variable:

$$\begin{aligned} \frac{d}{dx} f(g(x)) &= \frac{df}{dg} \cdot \frac{dg}{dx} \\ &= f'(g(x)) \cdot g'(x). \end{aligned}$$

Let's first consider  $f(x,y)$  where  $x=x(t)$ ,  $y=y(t)$  depends on another variable. Then:

$$\frac{df}{dt} = \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt}$$

$f(x(t), y(t))$

Ex:  $f(x,y) = 4x^2 + 3y^2$

$$x = x(t) = \sin t$$

$$y = y(t) = \cos t$$

$$\frac{df}{dt} = \frac{\partial f}{\partial x} \cdot \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt}$$

$$= (8x)(\cos t) + (6y)(-\sin t)$$

$$= 8\sin t \cos t - 6 \cos t \sin t$$

$$= 2 \sin t \cos t = \sin(2t)$$

Ex:  $f(x,y) = \sqrt{x^2 - y^2}$

$$x = x(t) = e^{2t}$$

$$y = y(t) = e^{-t}$$

$$\begin{aligned}\frac{df}{dt} &= \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt} \\ &= \left( \frac{2x}{\sqrt{x^2-y^2}} \right) (2e^{2t}) + \left( \frac{-2y}{\sqrt{x^2-y^2}} \right) (-e^{-t}) \\ &= \frac{4e^{4t^2} + 2e^{t^2}}{\sqrt{e^{4t^2} - e^{t^2}}}\end{aligned}$$

Now Consider  $f(x,y)$ , and let  
 $x = x(u,v)$ ,  $y = y(u,v)$ . The function  
 $f$  depends on  $u, v$ ,  $f = f(x(u,v), y(u,v))$ .

$$\begin{array}{ccc} & f(x(u,v), y(u,v)) & \\ & \swarrow \quad \searrow & \\ x(u,v) & & y(u,v) \\ \swarrow \quad \searrow & & \swarrow \quad \searrow \\ u & v & u & v \end{array}$$

$$\frac{\partial f}{\partial u} = \frac{\partial f}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial u}$$

$$\frac{\partial f}{\partial v} = \frac{\partial f}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial v}$$

Ex:  $f(x,y) = e^{xy}$ ,  $x=u+v$   
 $y=uv$ .

Let's find  $\frac{\partial f}{\partial u}$  and  $\frac{\partial f}{\partial v}$ .

$$\frac{\partial f}{\partial u} = \frac{\partial f}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial u}$$

$$= (ye^{xy})(1) + (xe^{xy})(v)$$

$$= uv e^{(u+v)uv} + (u+v)v e^{(u+v)uv}$$

$$= (2uv + v^2) e^{(u+v)uv}$$

$$\frac{\partial f}{\partial v} = \frac{\partial f}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial v}$$

$$= (ye^{xy})(1) + (xe^{xy})(u)$$

$$= uv e^{(u+v)uv} + (u+v)u e^{(u+v)uv}$$

$$= (u^2 + 2uv) e^{(u+v)uv}$$
